# Using genomics to predict and classify population responses to exposures

Classify: Who has been exposed to a damaging agent?

# Using genomics to predict and classify population responses to exposures

Classify: Who has been exposed to a damaging agent?

**Can we identify genetic biomarkers of exposure**

# Arsenic:

Inorganic arsenic is a ubiquitous environmental pollutant and known human carcinogen

SCIENCE VOL 315 23 MARCH 2007  
**A Sluggish Response to Humanity's  
Biggest Mass Poisoning**

Chronic exposure results in many **cancers**:  
skin, bladder, lung, liver,  
prostate and kidney

1987: Classified as **Group 1**  
Carcinogen by International  
Agency for Research on  
Cancer (IARC)

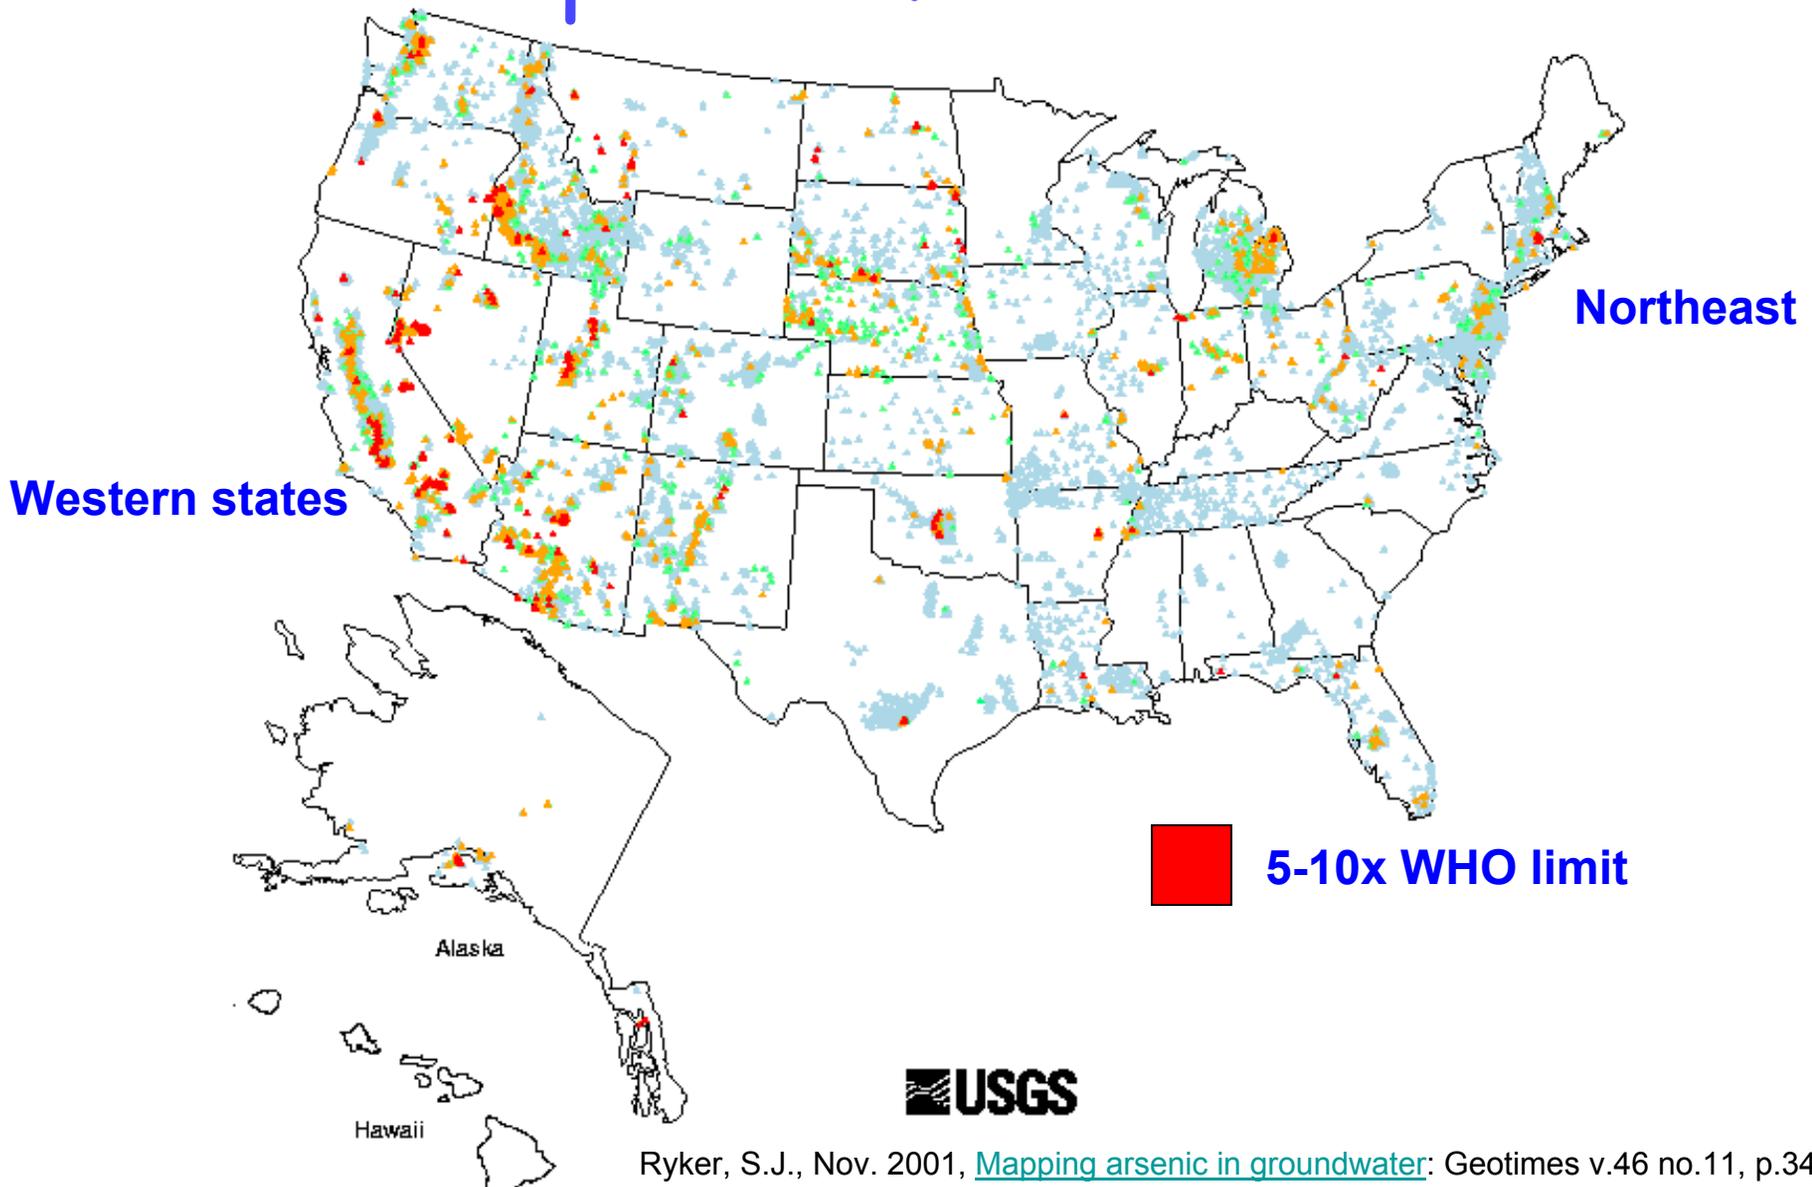

1994: W.H.O. Recommended  
Guideline Value of **10  $\mu\text{g}/\text{L}$**   
**arsenic in drinking water**

In Bangladesh ~30 million exposed to levels that FAR exceed WHO limit

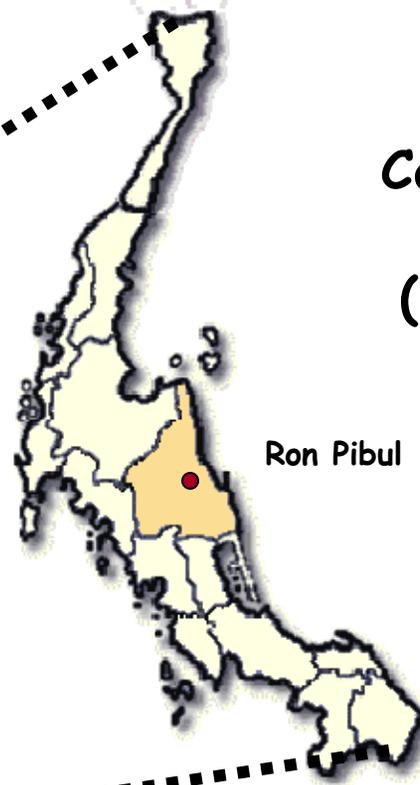

SCIENCE VOL 315 23 MARCH 2007  
**A Sluggish Response to Humanity's  
Biggest Mass Poisoning**

# Arsenic contamination is ALSO a problem in USA

# Study site: Ron Pibul District, Thailand

Nakhon Si Thammarat  
Province

Caused by 30 years  
of tin-mining  
(1950's to 1980's)

up to 100X WHO limit  
(10ppb)  
~Bangladesh exposures

# *In utero* arsenic exposure in rodents - recent alarming findings

In mice

exposure to arsenic during gestation results in **5-fold increase** in hepatocellular carcinomas

Gene expression changes in livers of offspring exposed to arsenic *in utero* when reach adulthood

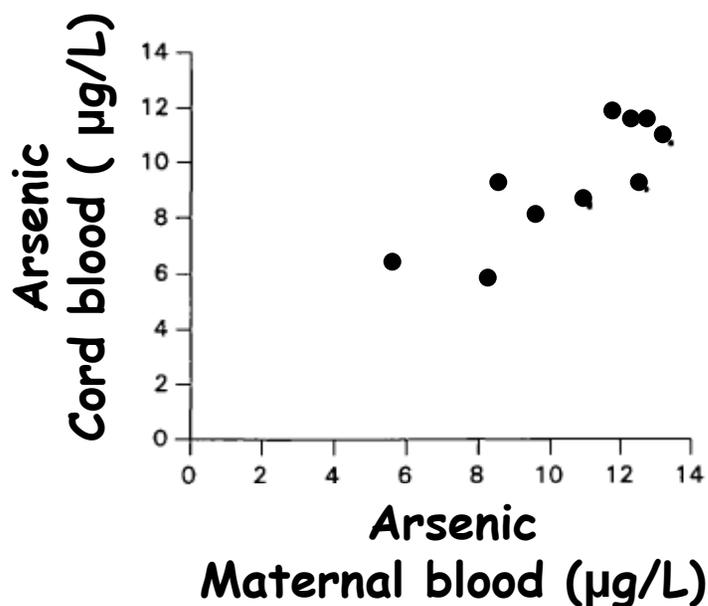

Waalkes et al., Tox Sci 2003

**Gene expression changes evident in offspring when reach adulthood..  
Could this be epigenetic reprogramming of gene expression?**

# Prenatal arsenic exposure in humans

Arsenic crosses the placenta  
in humans

Concha et al, Tox Sci 1998

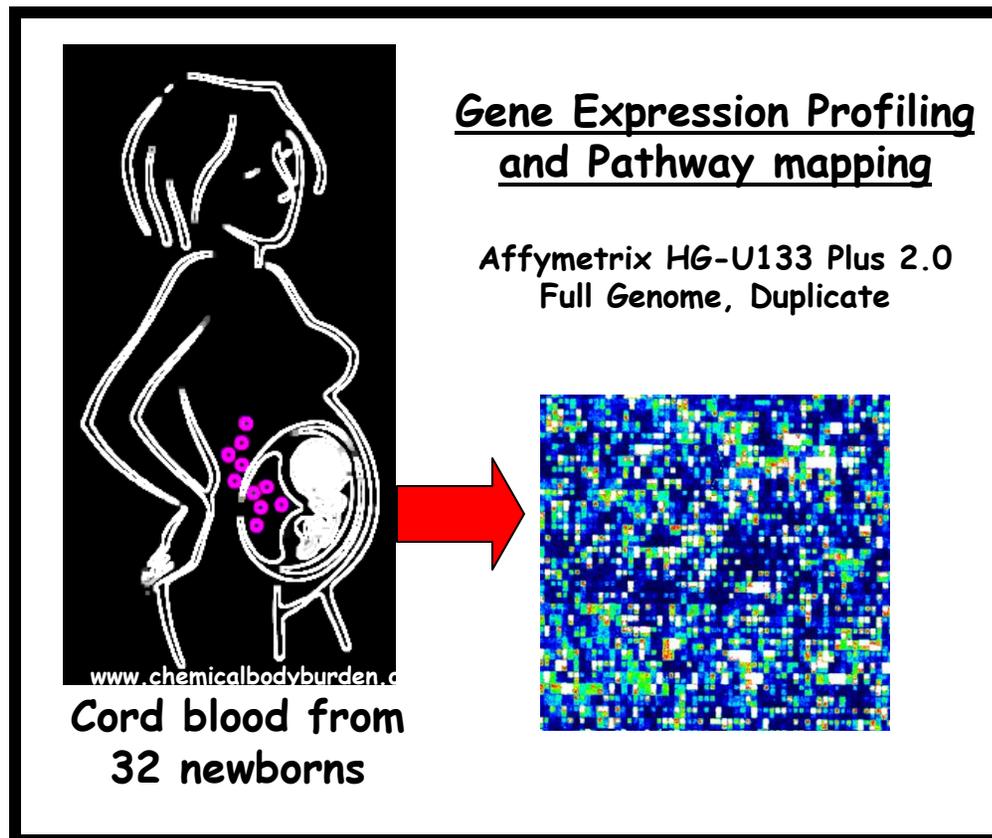

Long term health effects

Increased **mortality** from  
lung cancer and  
liver cancer from  
prenatal and early  
childhood arsenic  
exposures

Smith et al, EHP 2006  
Cancer Epidemiology  
Biomarkers & Prevention  
2008.

# Expression profiling of blood from 32 newborns from Thailand whose mothers were exposed to varying levels of arsenic

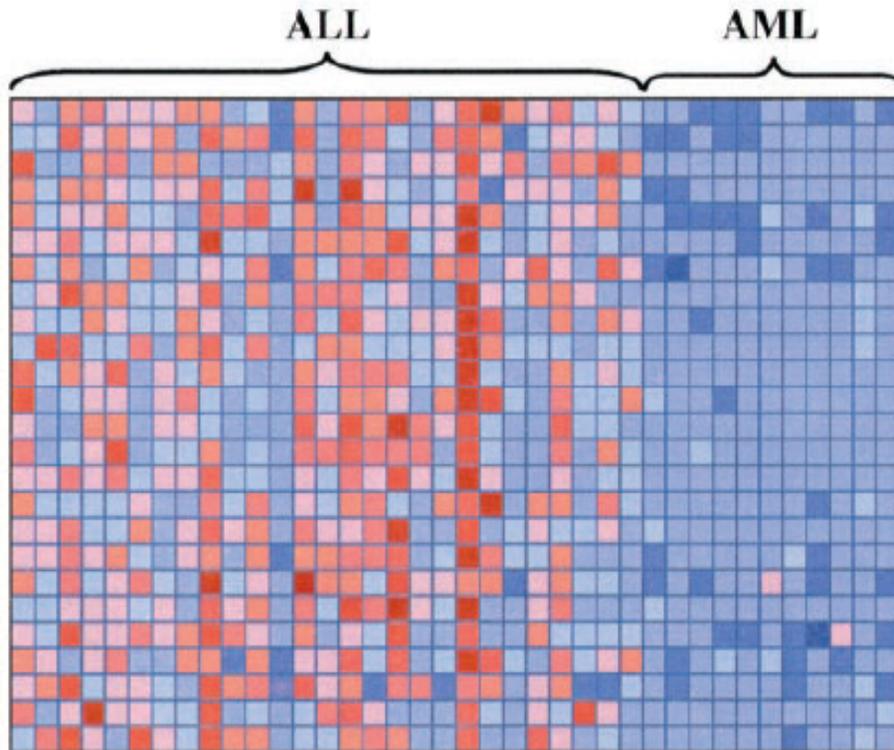

What is the genome-wide impact of **prenatal** exposure??

Can we identify genes as **biomarkers** of prenatal exposure to arsenic??

Can we use gene expression signatures  
from a **training** population of newborns  
to classify arsenic exposure in  
a **test** population??

Application of Two-Class  
Prediction Algorithm

# Classic Example of Two-Class Prediction - to Distinguish tumor types

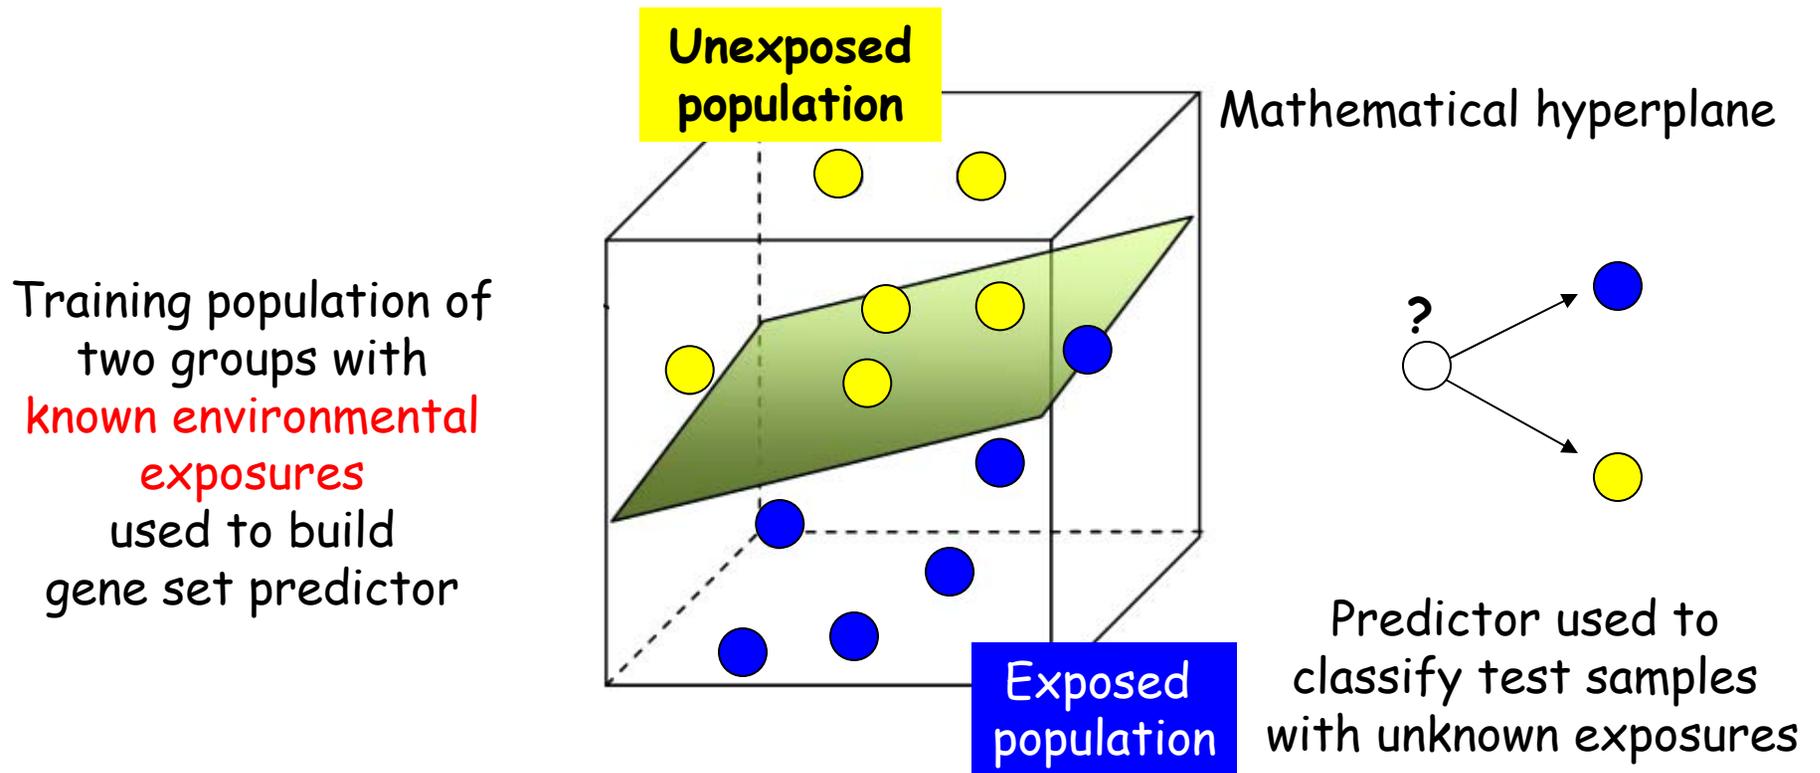

- 1) Use a **training population** to identify expression patterns that distinguish between two classes to create class **predictor** gene set
- 2) predictor then used to **classify** leukemia subtypes (85% accuracy)

# New tool development: measure exposures in the population

tools

Liver microreactor Fluidics array

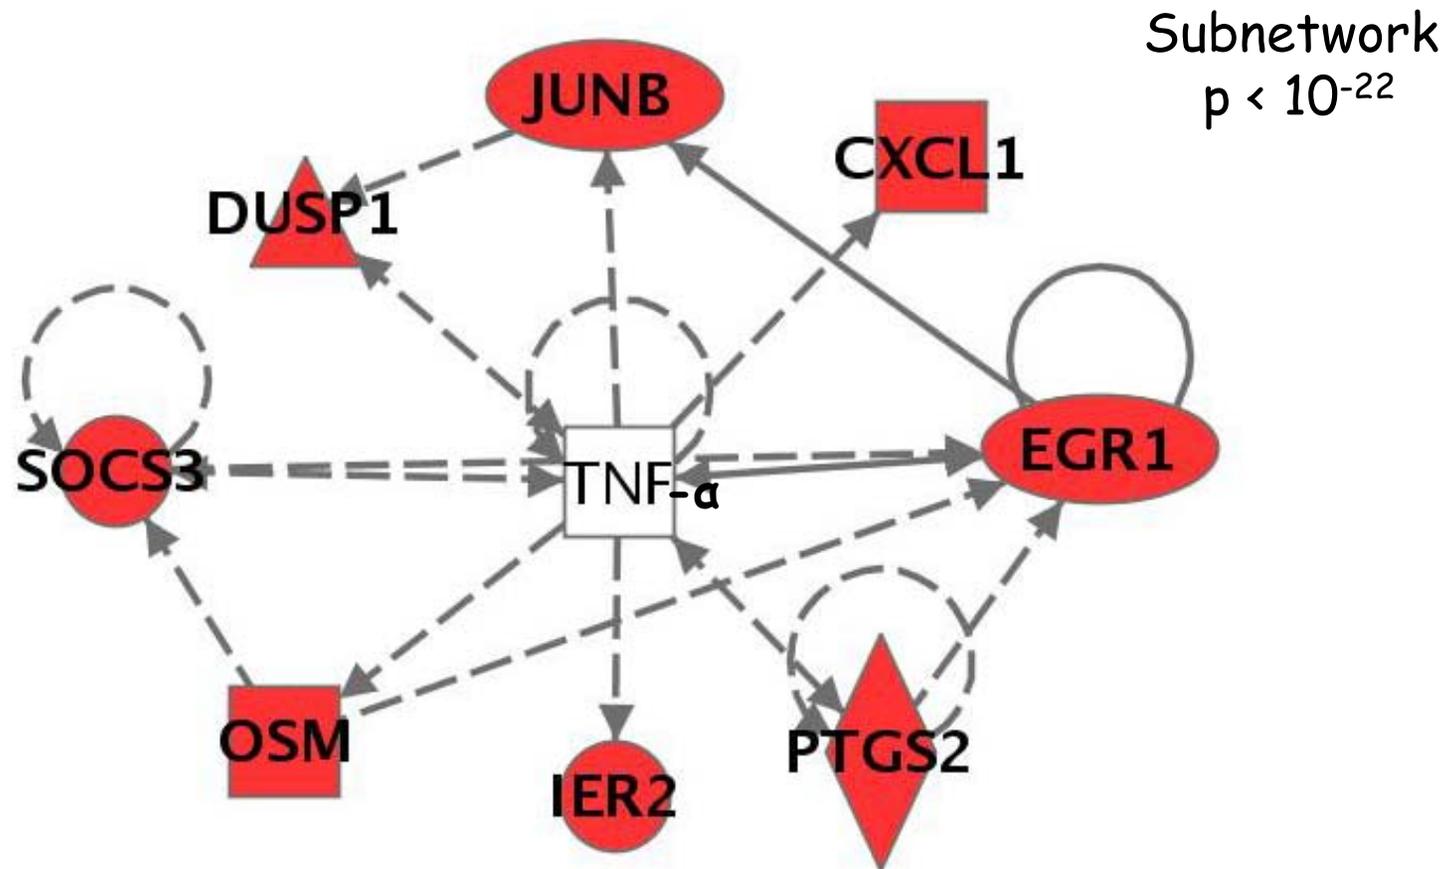

Microarray Mini-array: real time

Biomarkers of environmental exposures

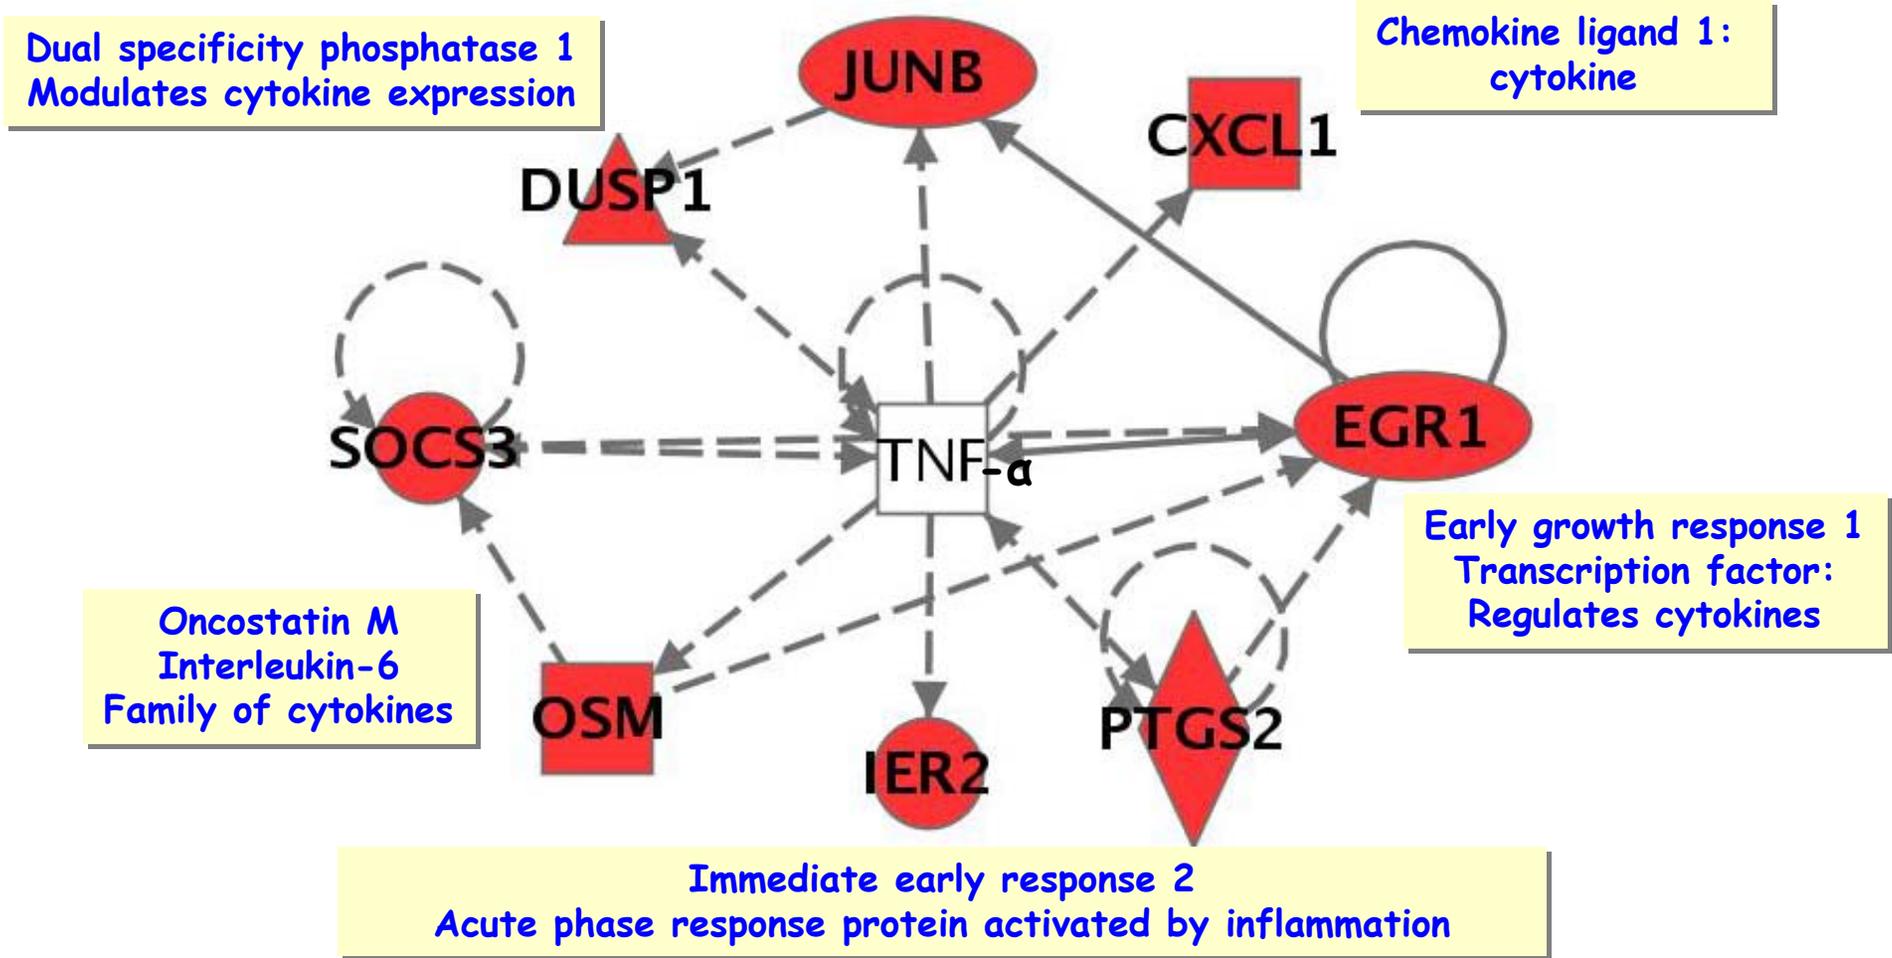

Are there known molecular interactions among the 11 biomarkers?

# 8 of 11 Potential Biomarker Genes are associated with the cytokine, TNF- $\alpha$

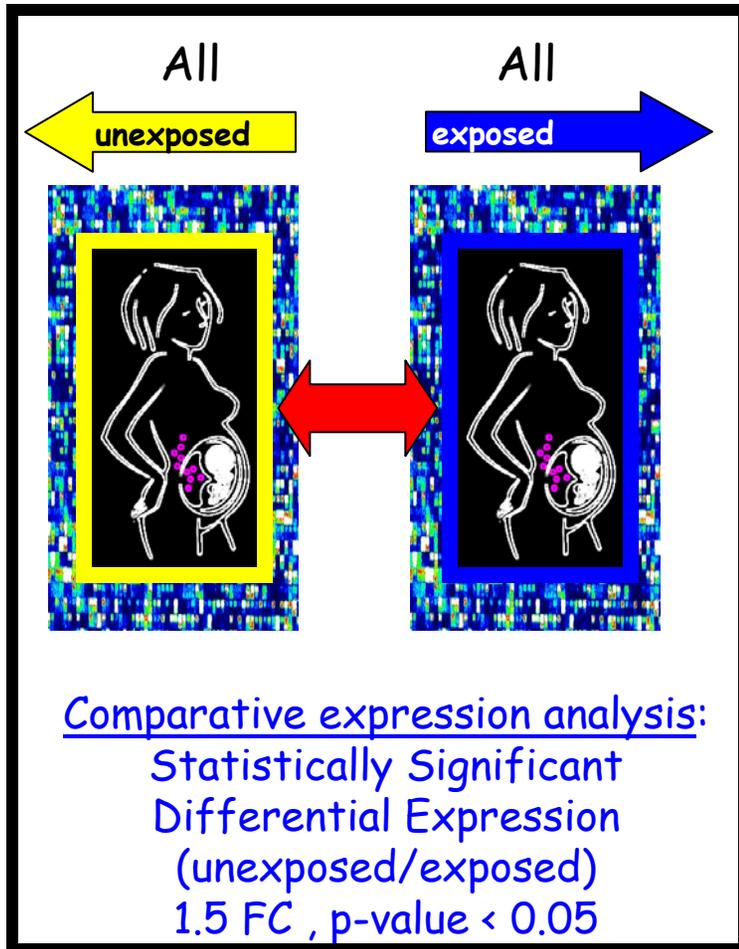

TNF- $\alpha$  known to be induced by arsenic in animal models (Germolec et al 1996, 1997, 1998)

# 8 of 11 Potential Biomarker Genes are associated with the cytokine, TNF- $\alpha$

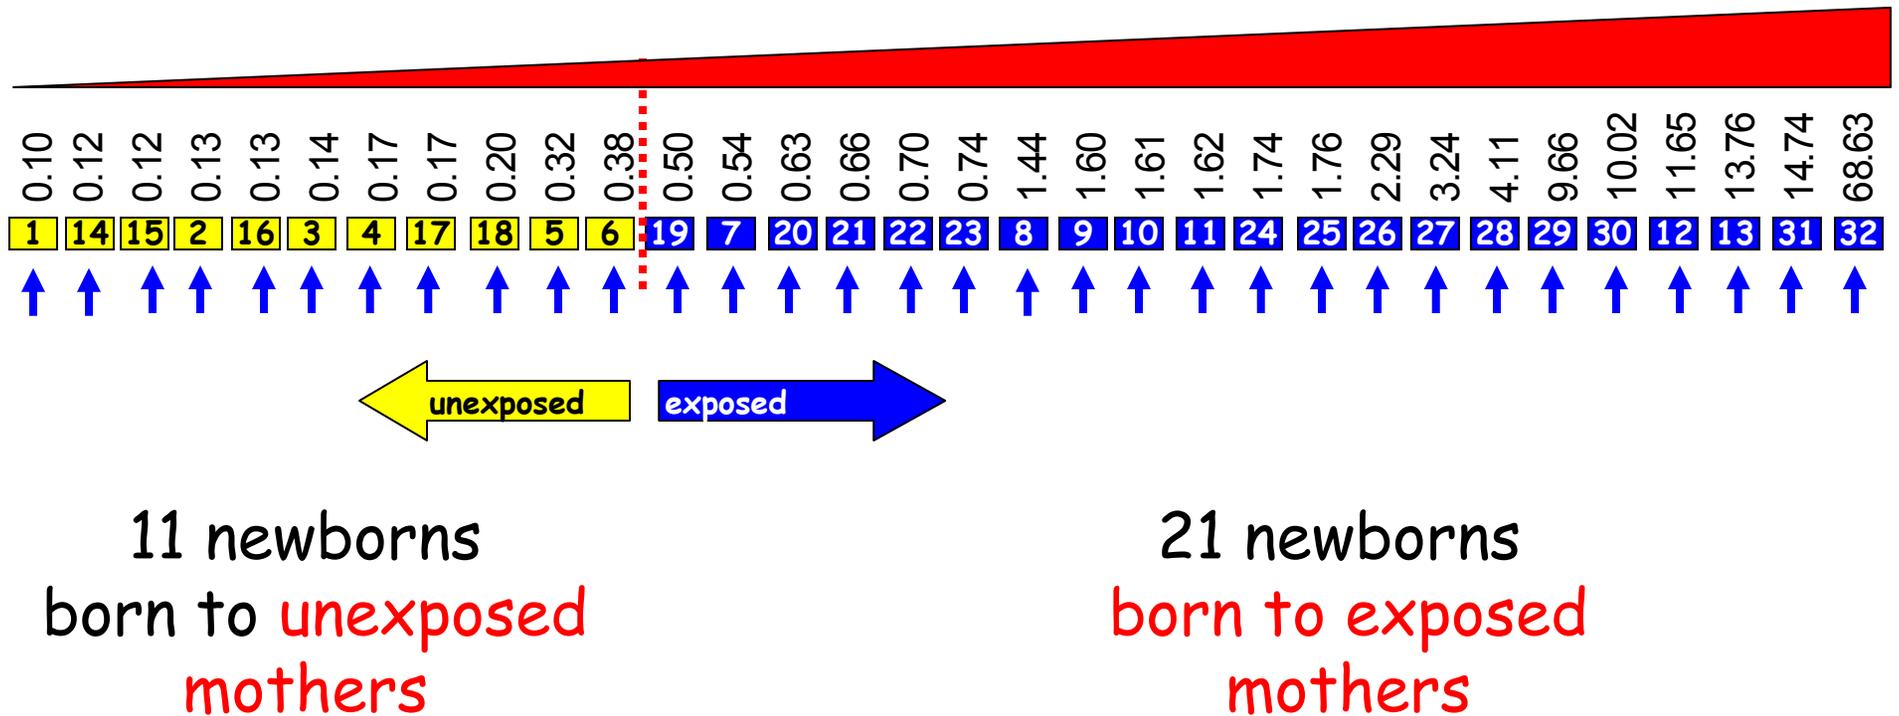

Stress Response: cytokines: inflammatory response

# What is genome-wide impact of prenatal arsenic exposure?

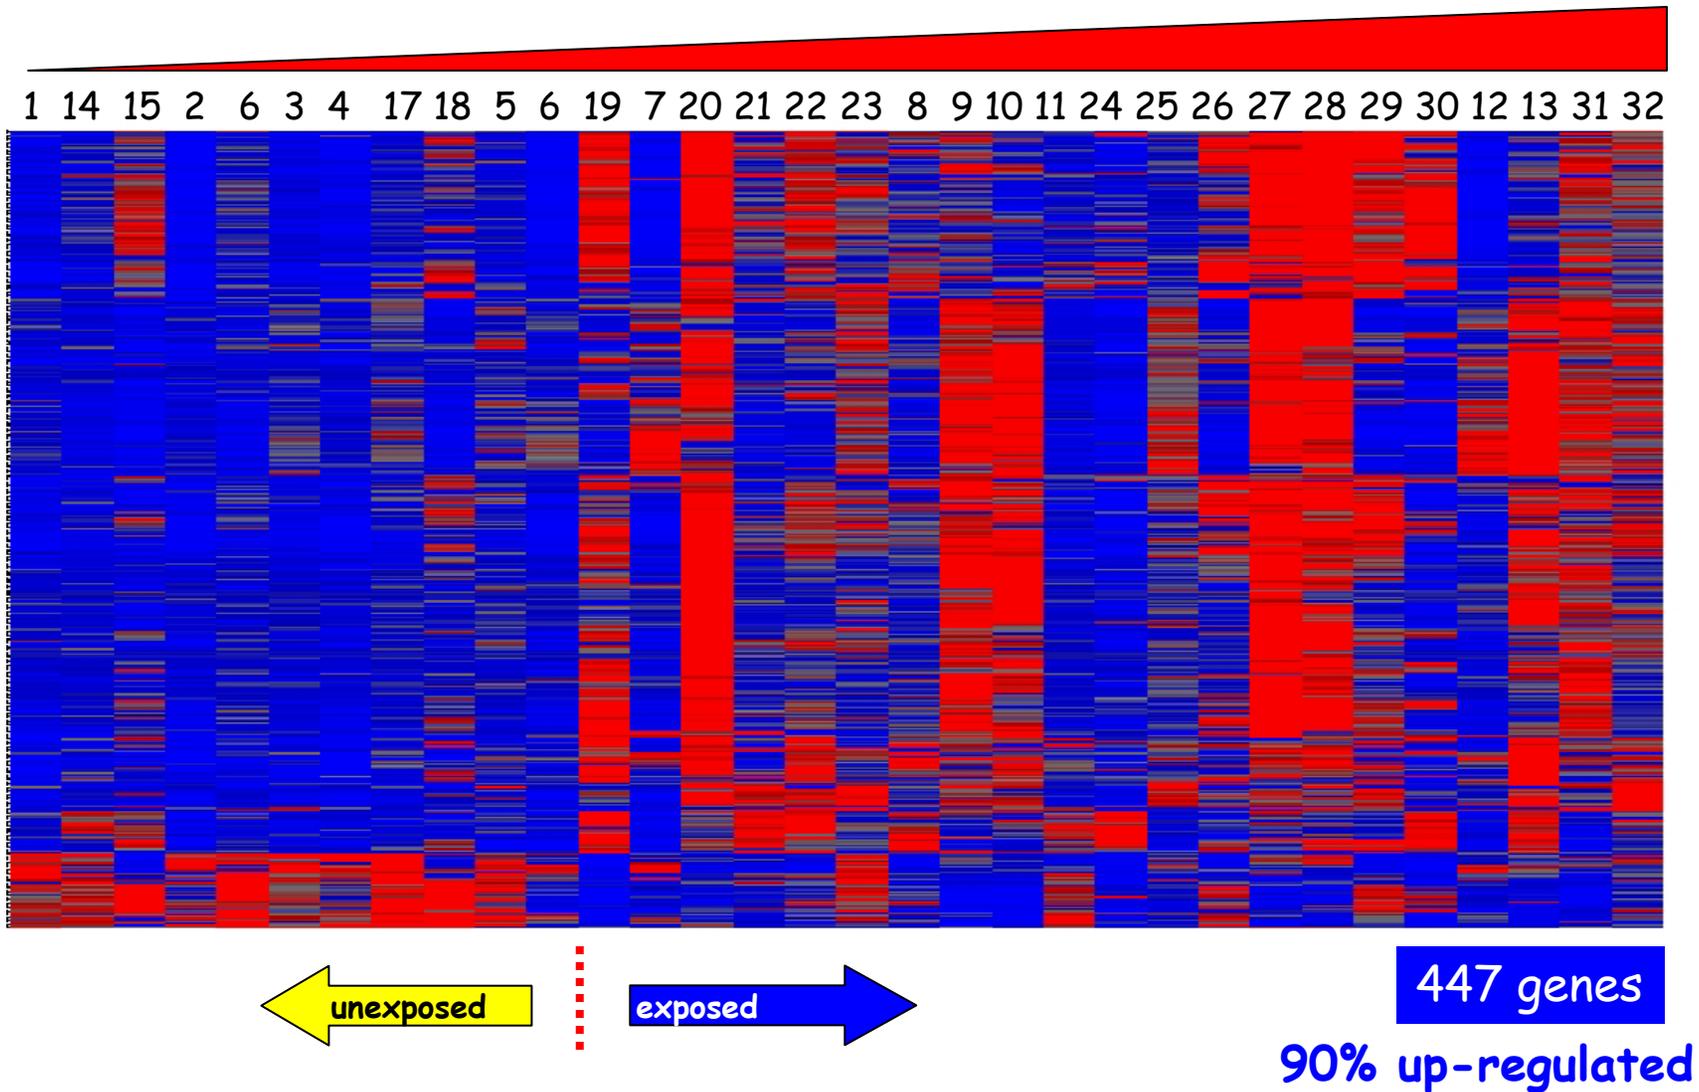

Identify genes differentially expressed between the **unexposed and exposed** populations

# Identifying Differentially Expressed Genes Between the Two Populations

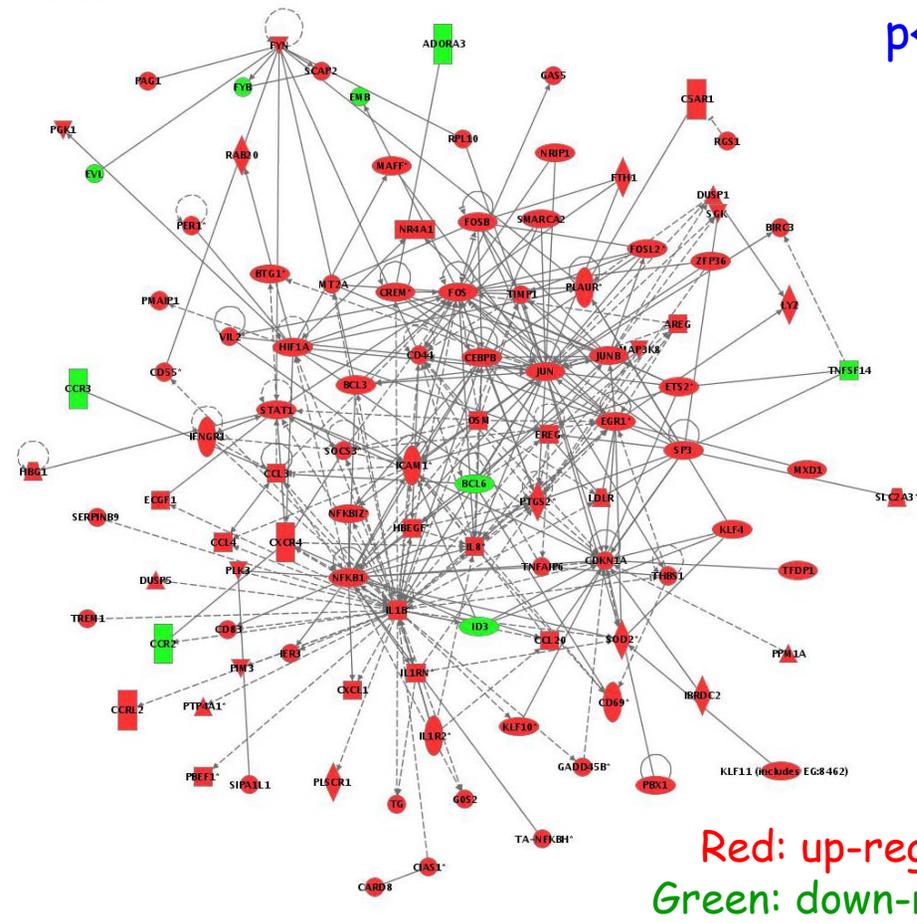

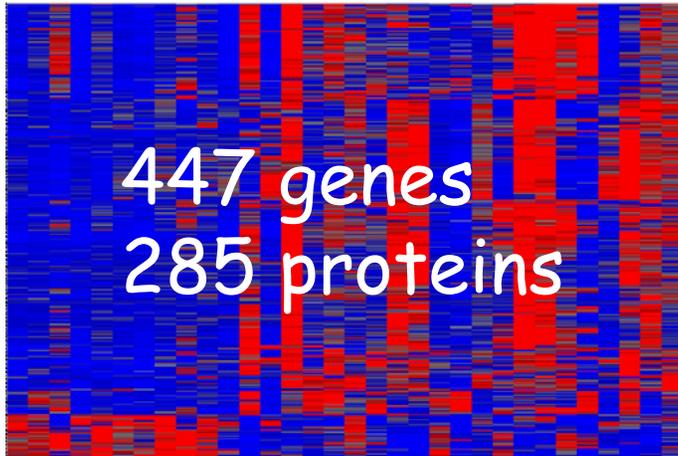

# Robust Genome Wide Changes of PRENATAL Arsenic Exposure

Are there **known molecular interactions** among the arsenic modulated genes??

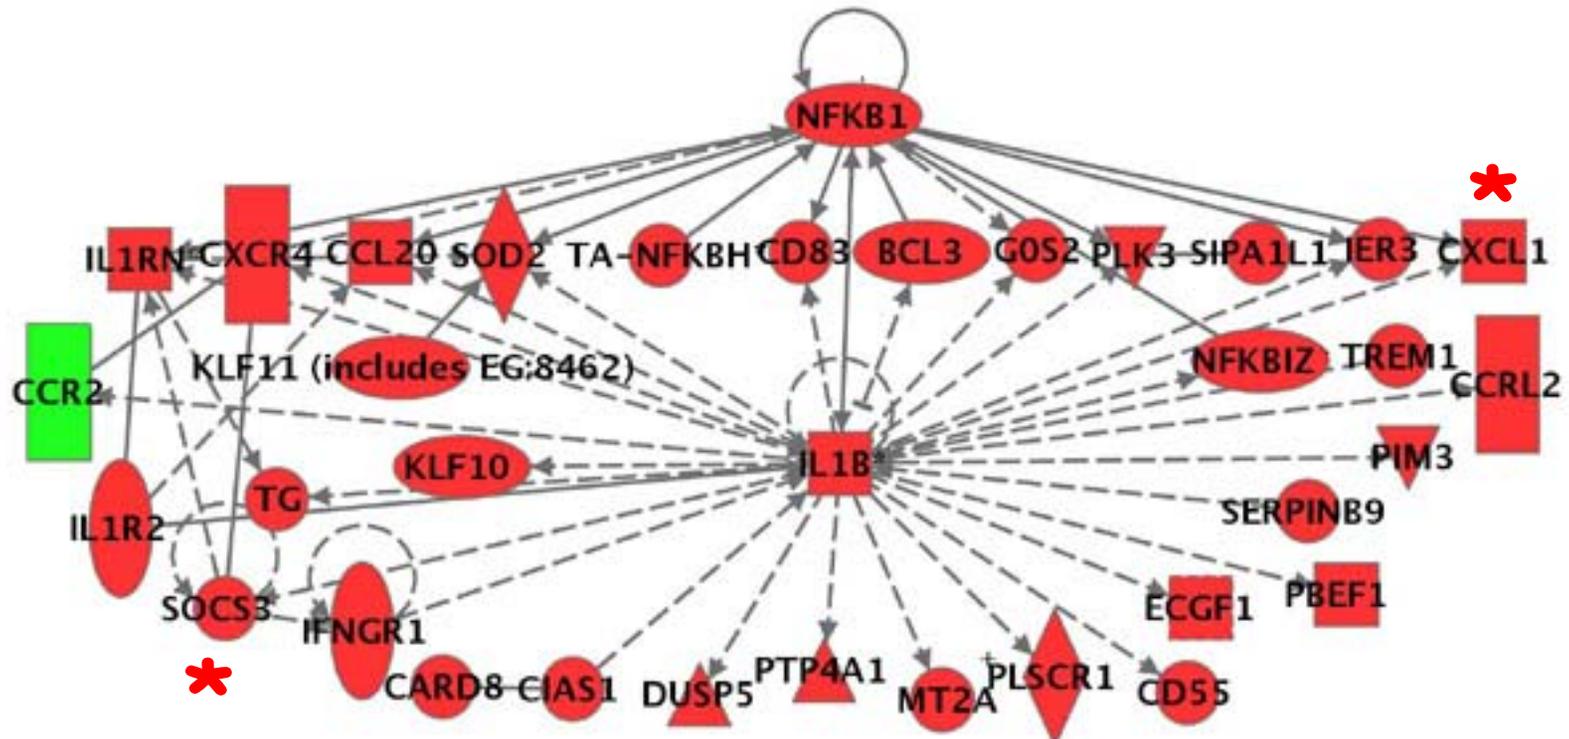

Which **biological pathways** are modulated upon exposure to arsenic??

# Large Arsenic-Modulated Interactome

105 proteins interact

# Subnetwork 1 integrates 2 biomarkers with nuclear transcription factor, NF-κB

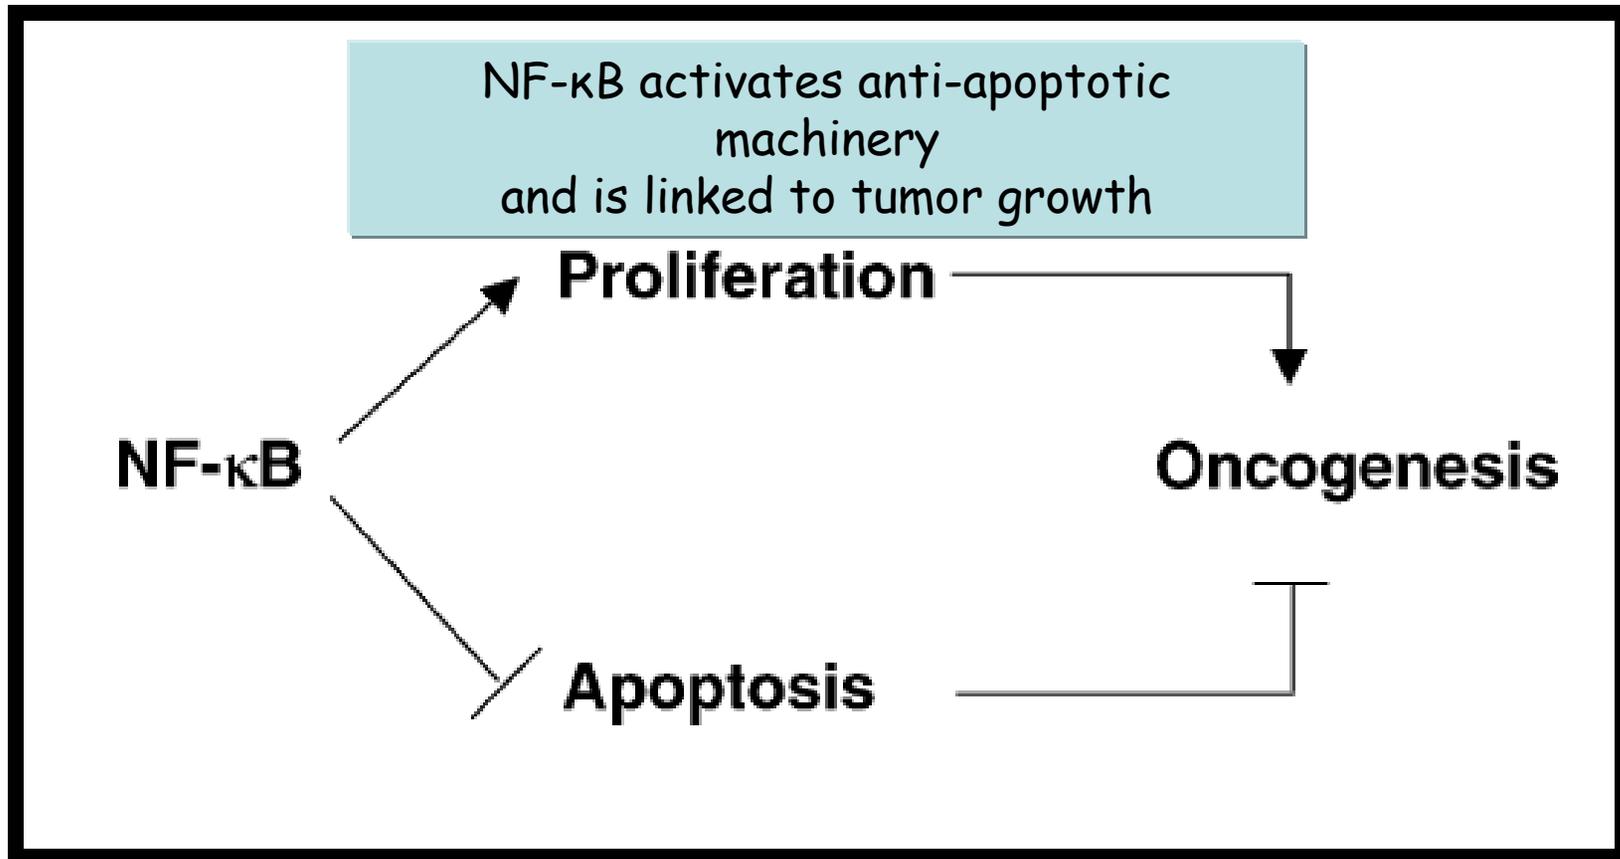

\* Biomarkers of prenatal arsenic exposure

NF-κB regulates inflammation-related molecules  
Note: all targets are increased

IL1-B is acute phase protein that increases in response to inflammation

NF-κB activation has been identified in cell culture treated with arsenic (Huang et al, MCB 2001)

# NF- $\kappa$ B is a key regulator of oncogenesis

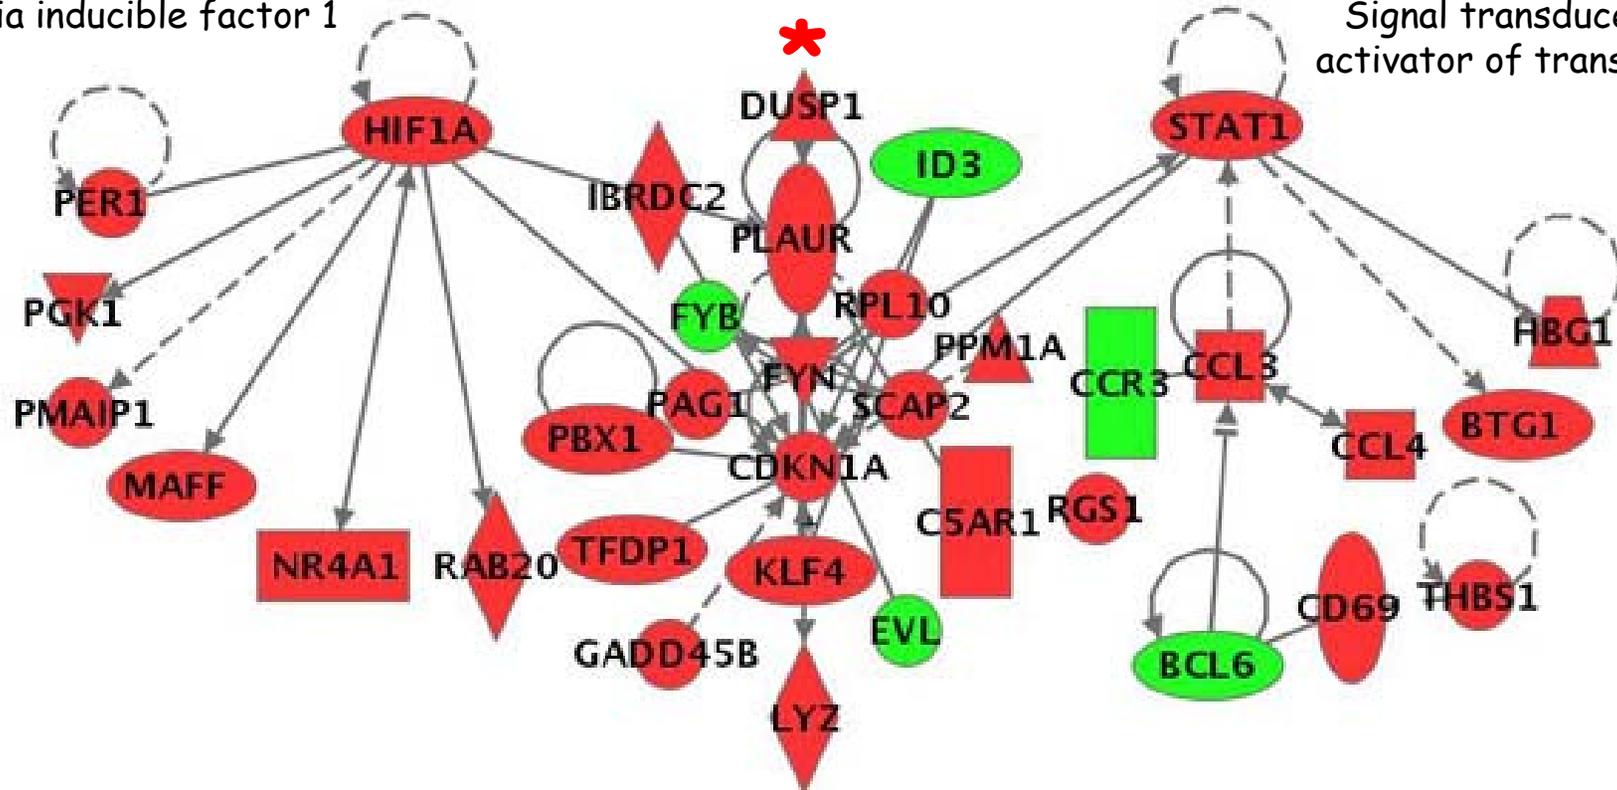

Transient gene expression changes or epigenetic reprogramming?

# Subnetwork 2 integrates DUSP1 with stress activated transcription factors

Hypoxia inducible factor 1

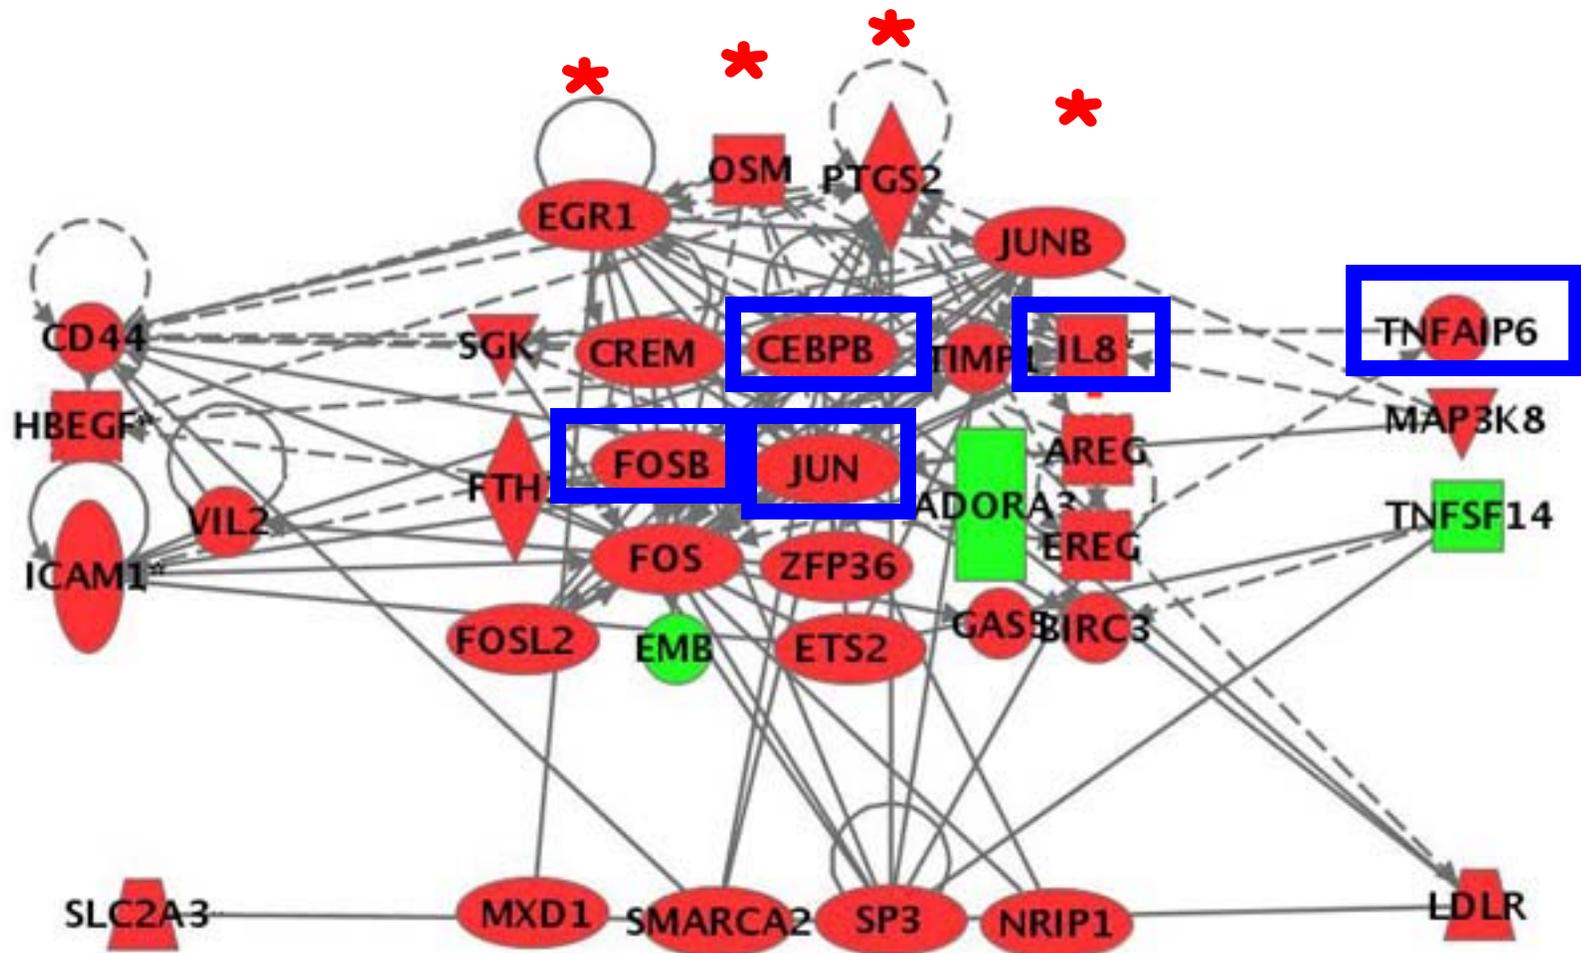

Signal transducer and activator of transcription

STAT1 involved in cytokine signal transduction  
 Activation of both transcription factors linked to arsenic exposure in  
 cell culture and animal models

Chelbi-alix et al, Oncogene 2003 Kamat et al, Tox Sci 2005

Subnetwork 3 integrates 4 biomarkers with five members of the IL-6 Signaling Pathway

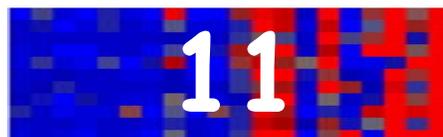

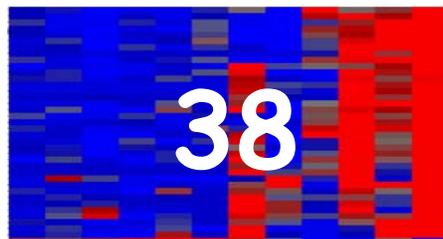

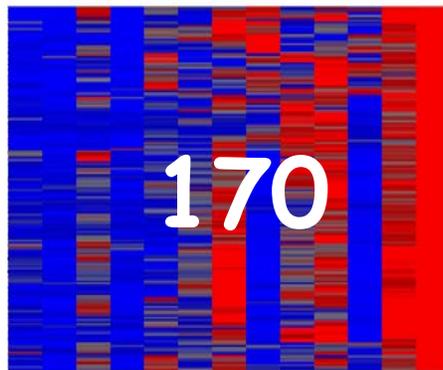

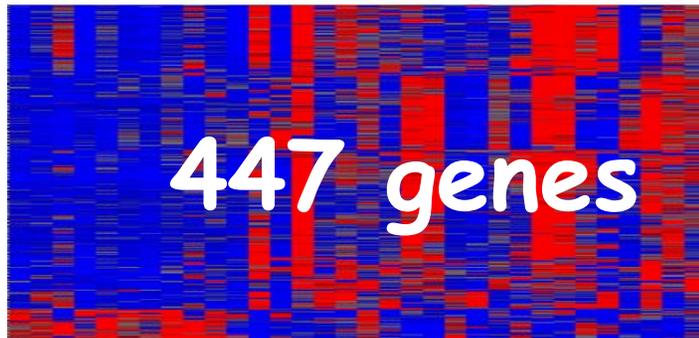

IL-6 is mediator of Acute-phase proteins

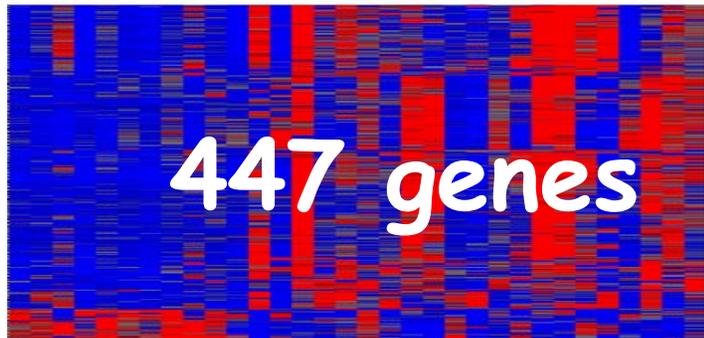

Evidence for Common Regulatory  
Control of the  
Arsenic-Associated genes??

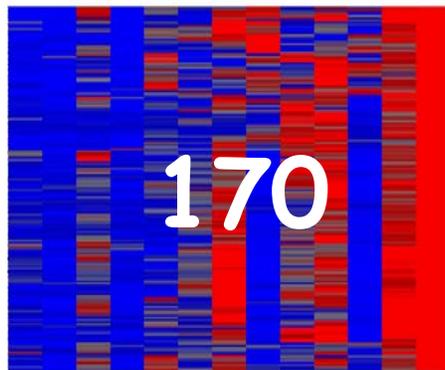

# Transcription factor binding site analysis

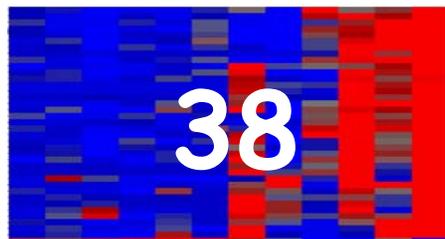

# Binding sites for three transcription factors show significant enrichment

# Establish Training Population based on extreme responders

# Alkylation-Sensitivity-Associated Gene Sets Identified by Integrating % Control Growth and Gene Expression

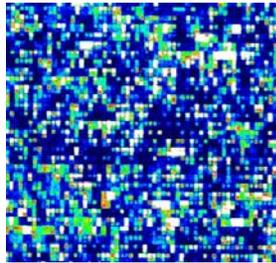

# Alkylation-Sensitivity-Associated Gene Sets Identified by Integrating % Control Growth and Gene Expression

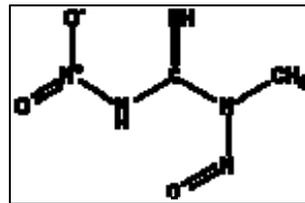

Basal and MNNG-induced transcripts  
were linked with sensitivity data

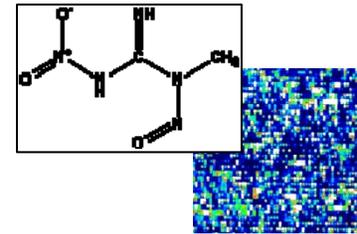

## Alkylation-Sensitivity-Associated Gene Sets

Basal

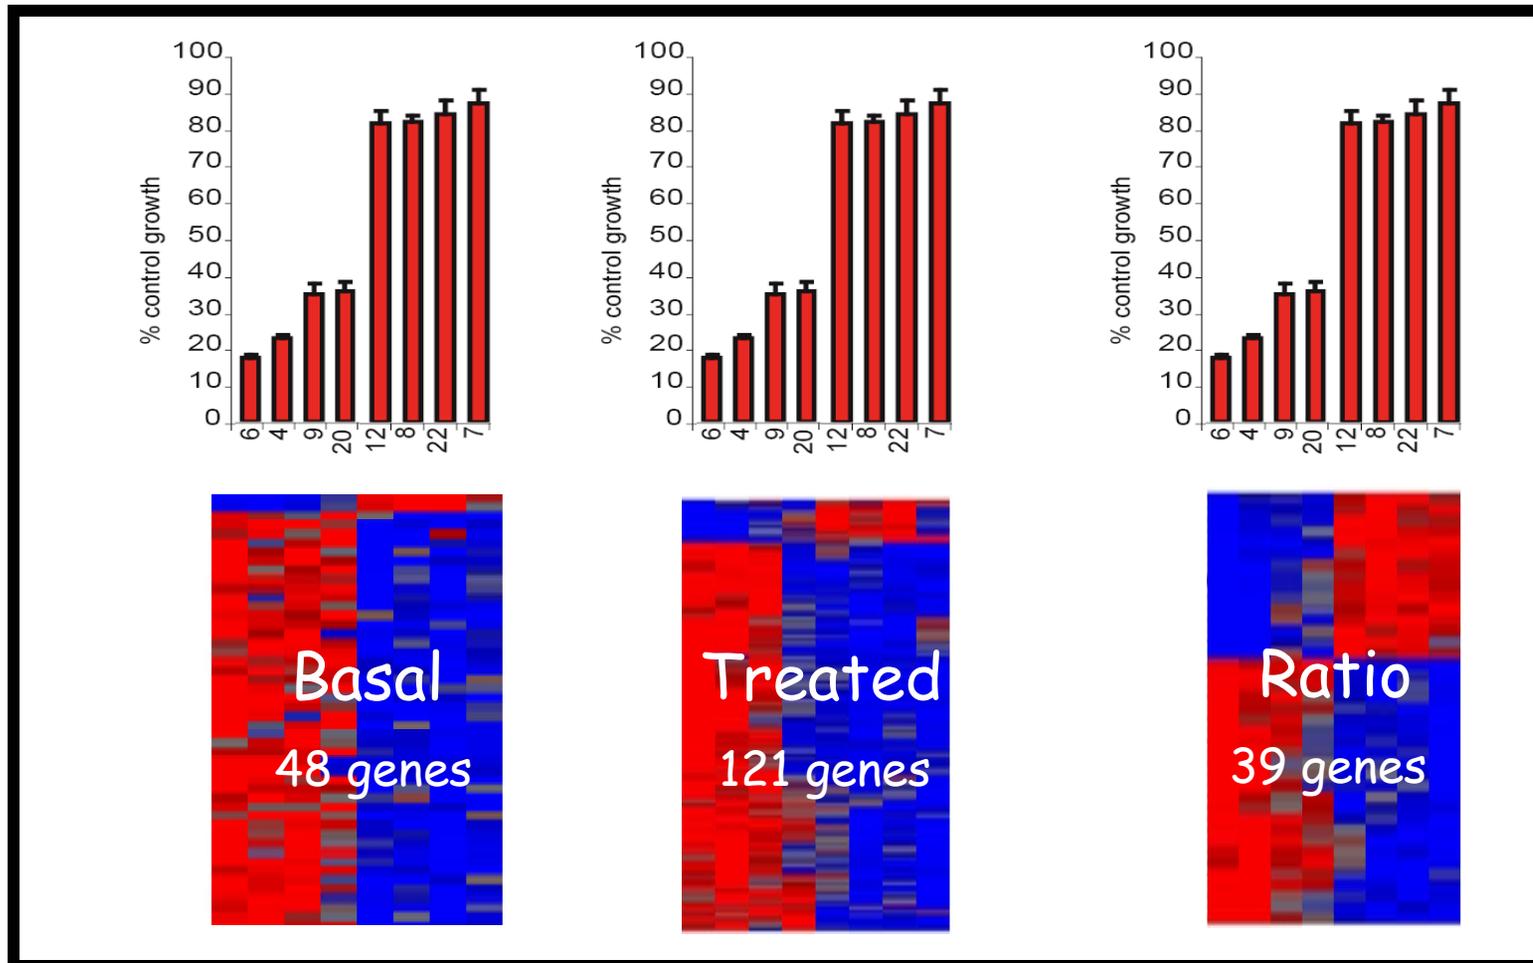

Treated

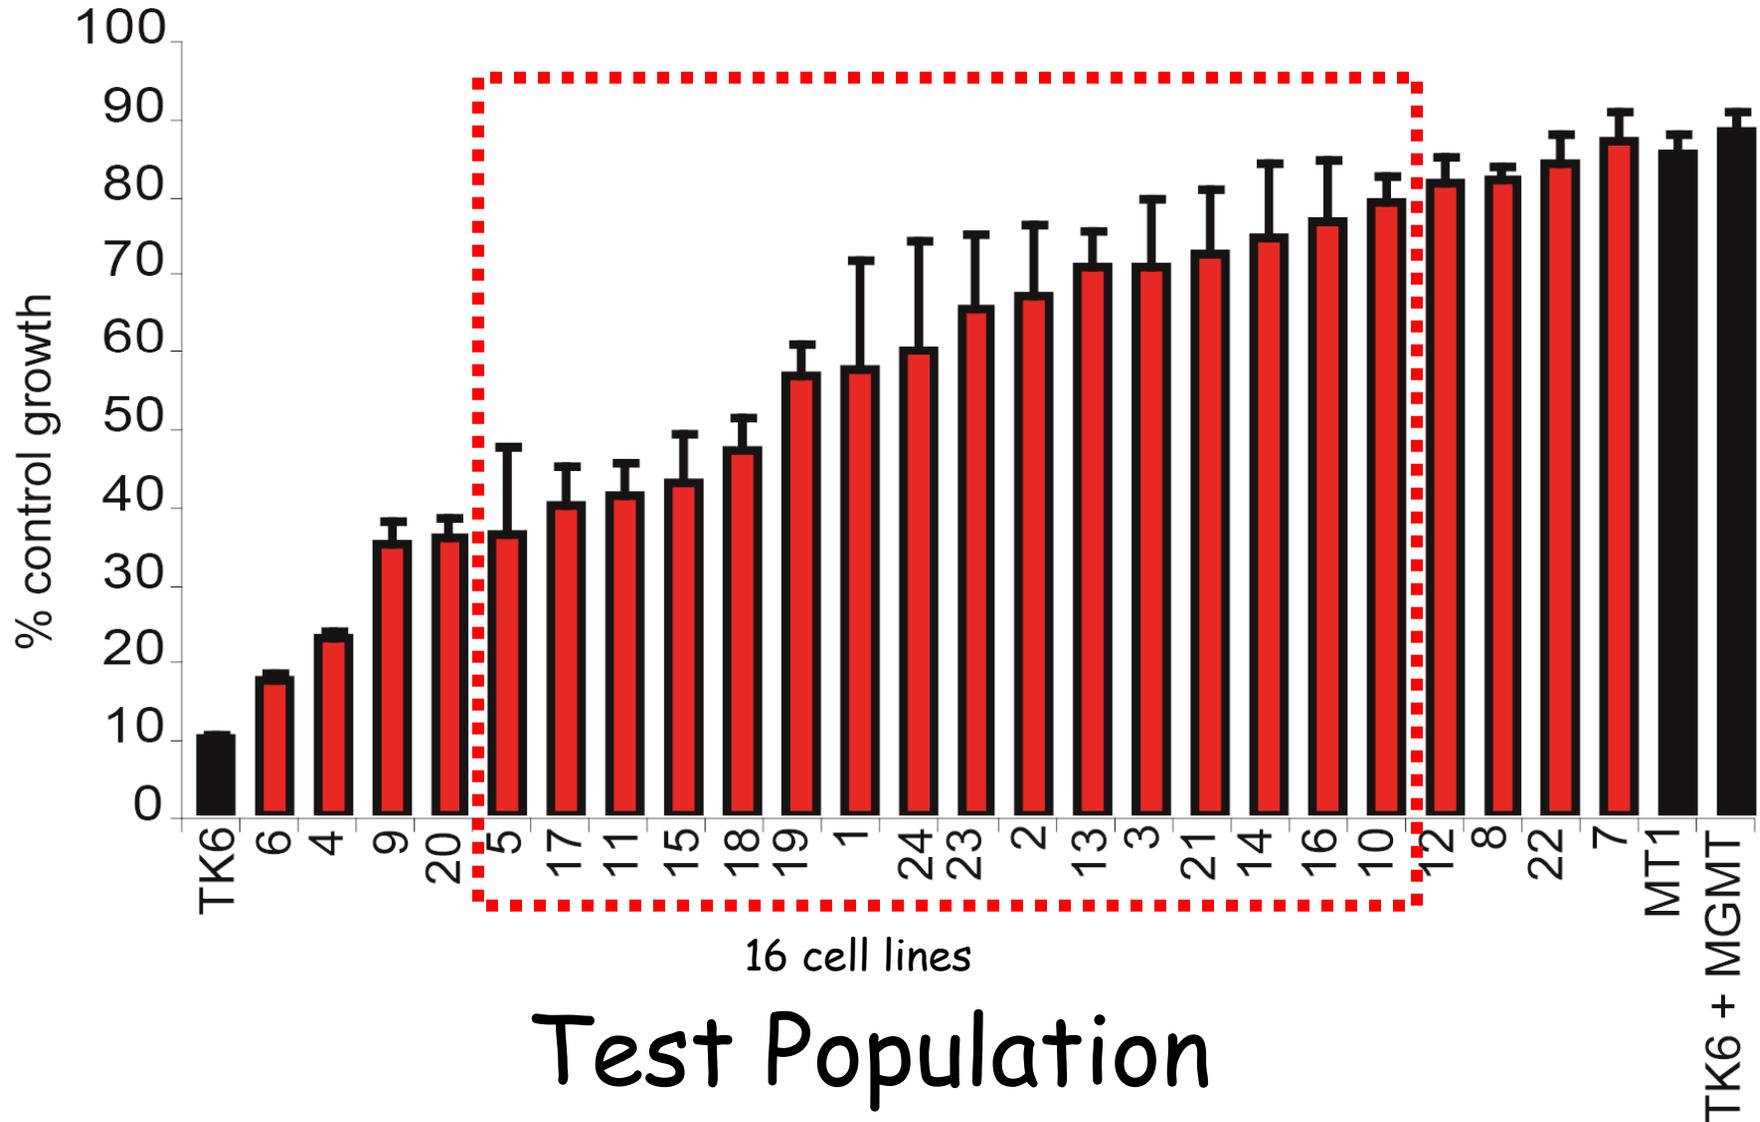

Ratio

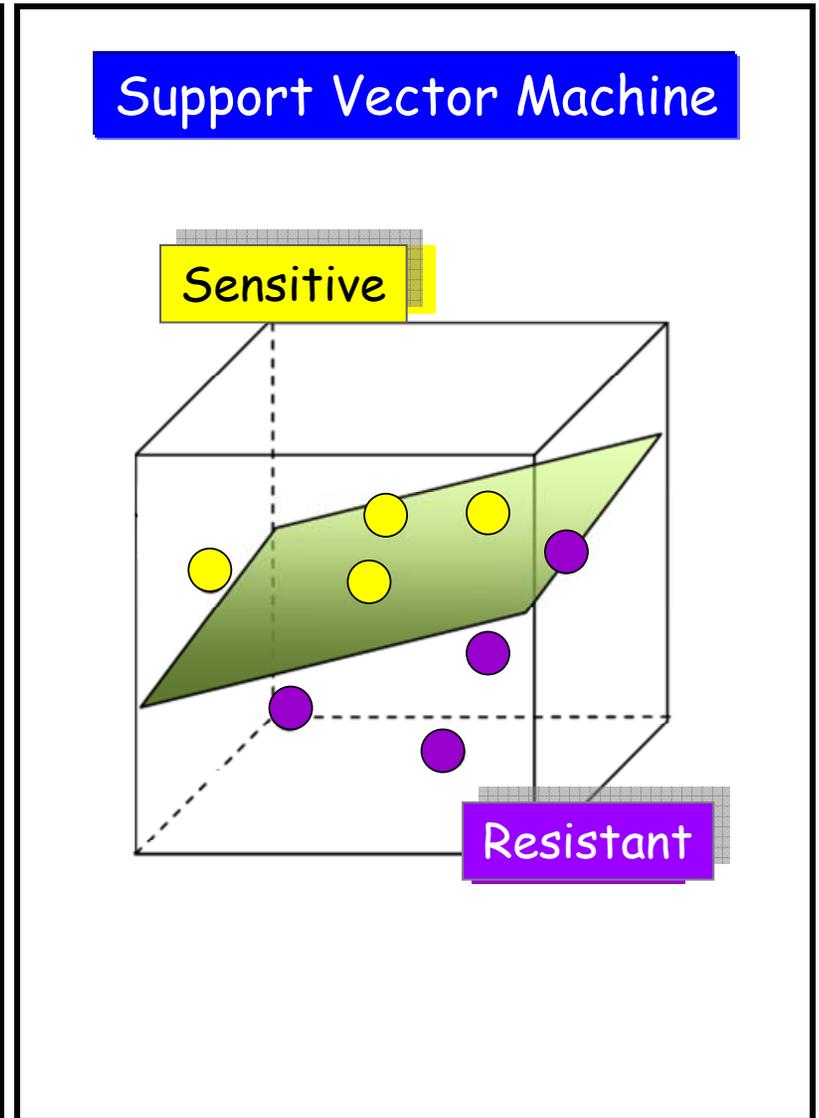

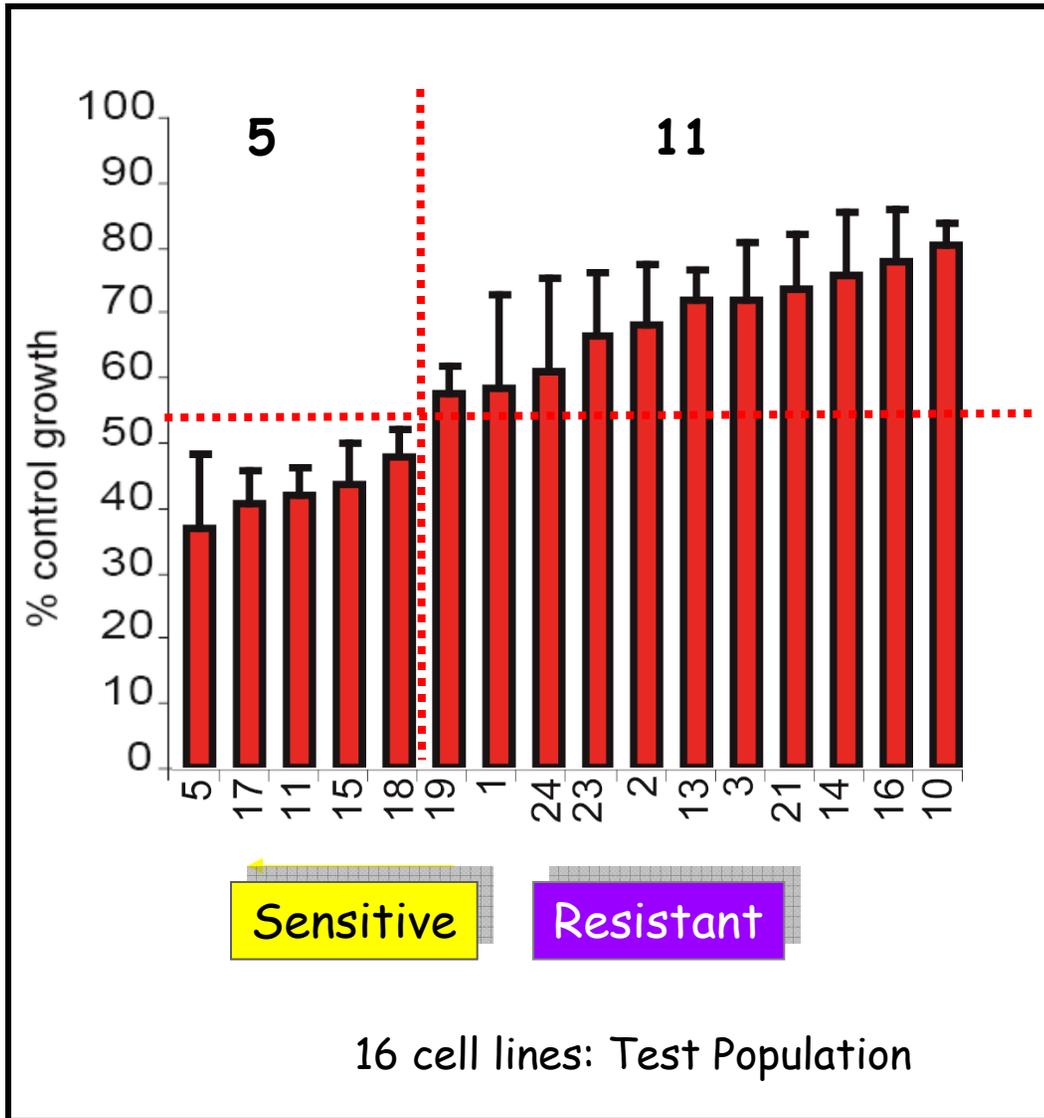

# Three ASA Gene Sets Identified

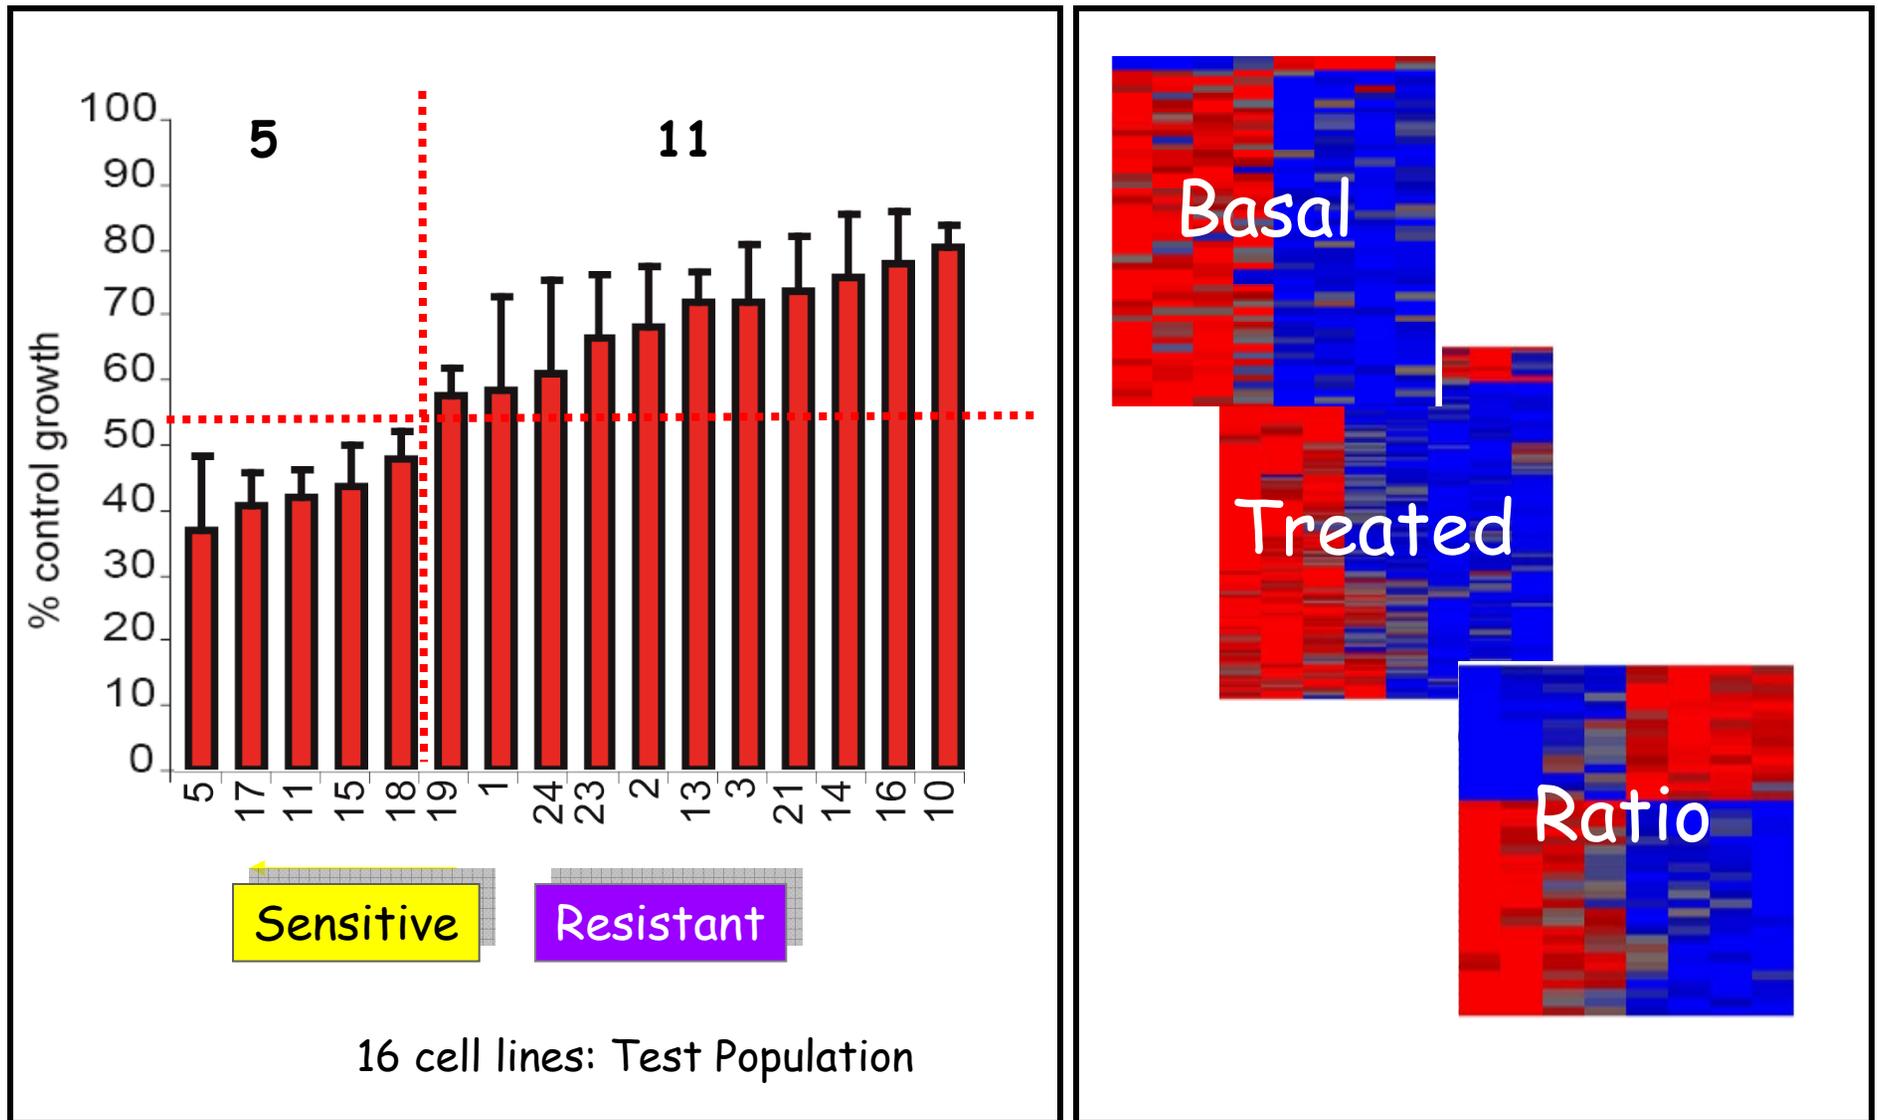

# Can the ASA gene sets PREDICT MNNG sensitivity in the Test Population?

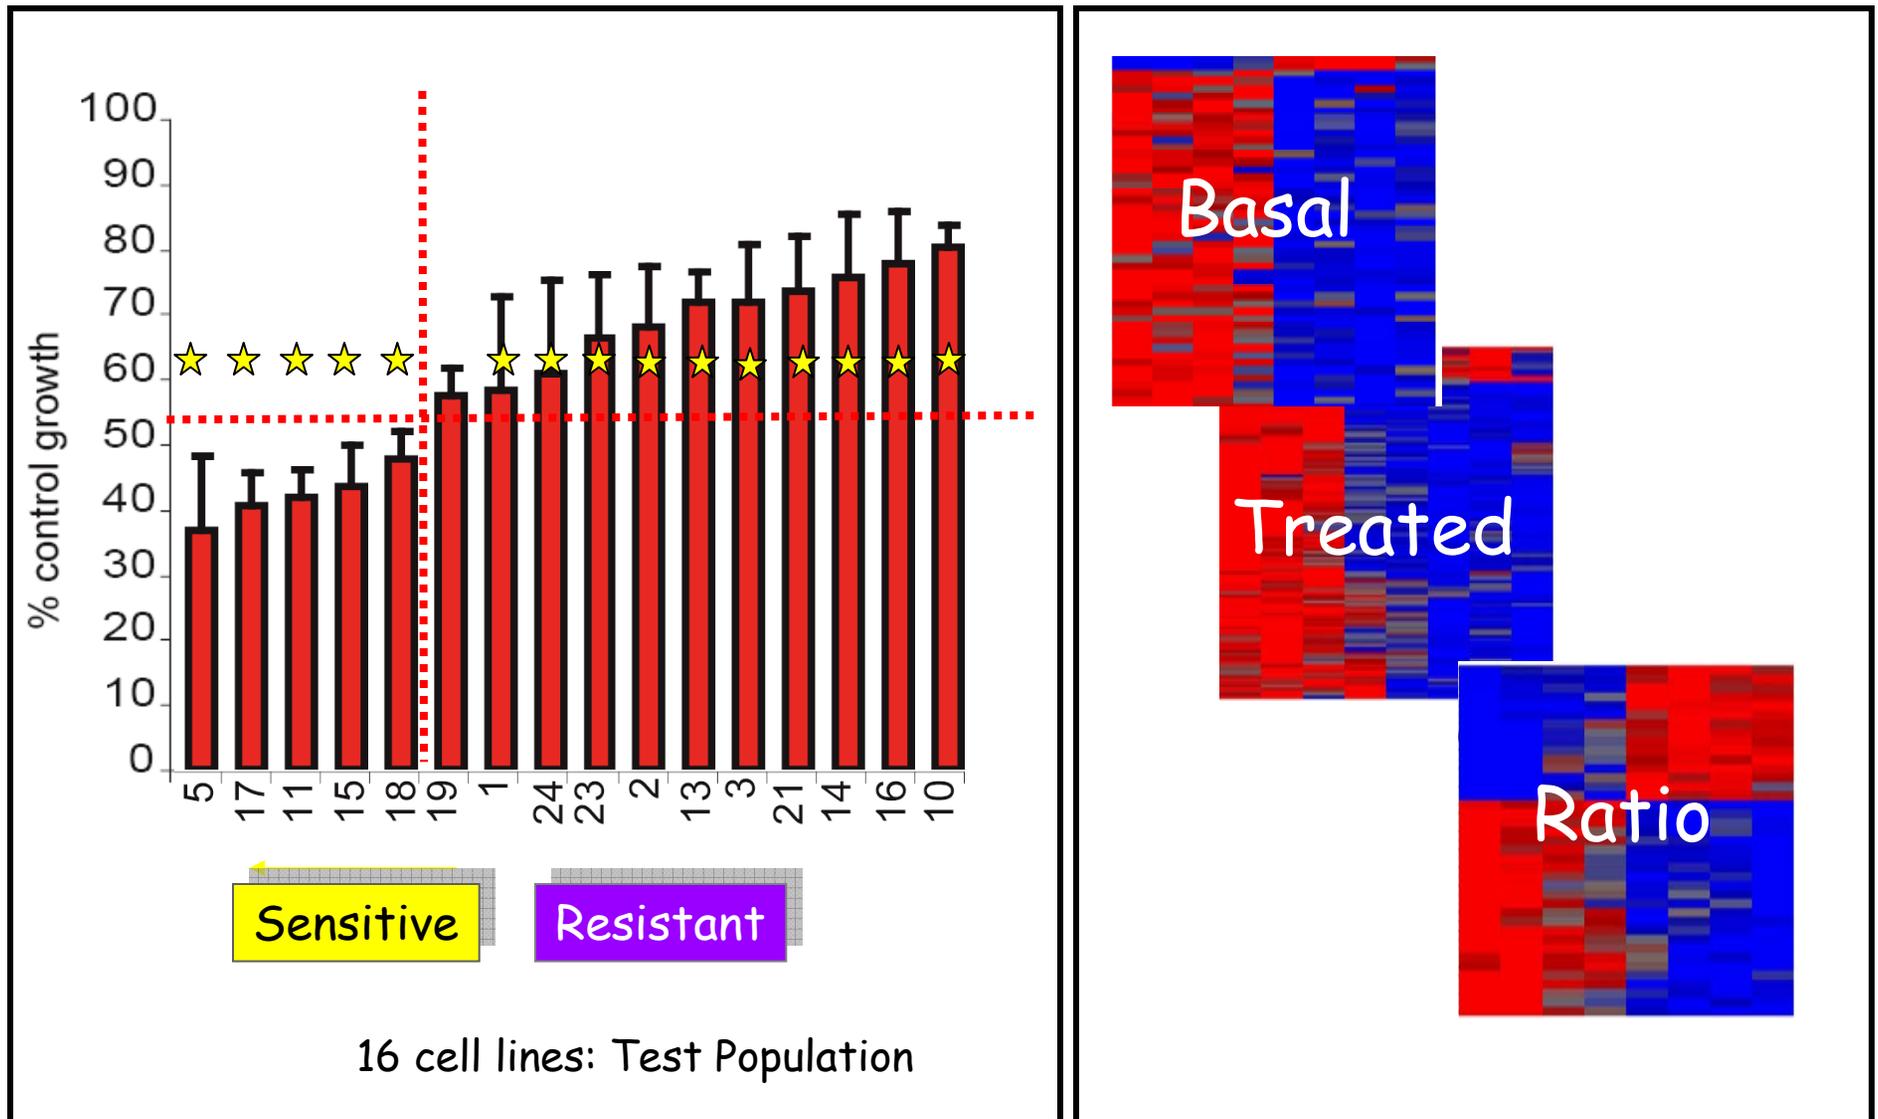

# Can the ASA gene sets PREDICT MNNG sensitivity in the Test Population?

# Can the ASA gene sets PREDICT MNNG sensitivity in the Test Population?

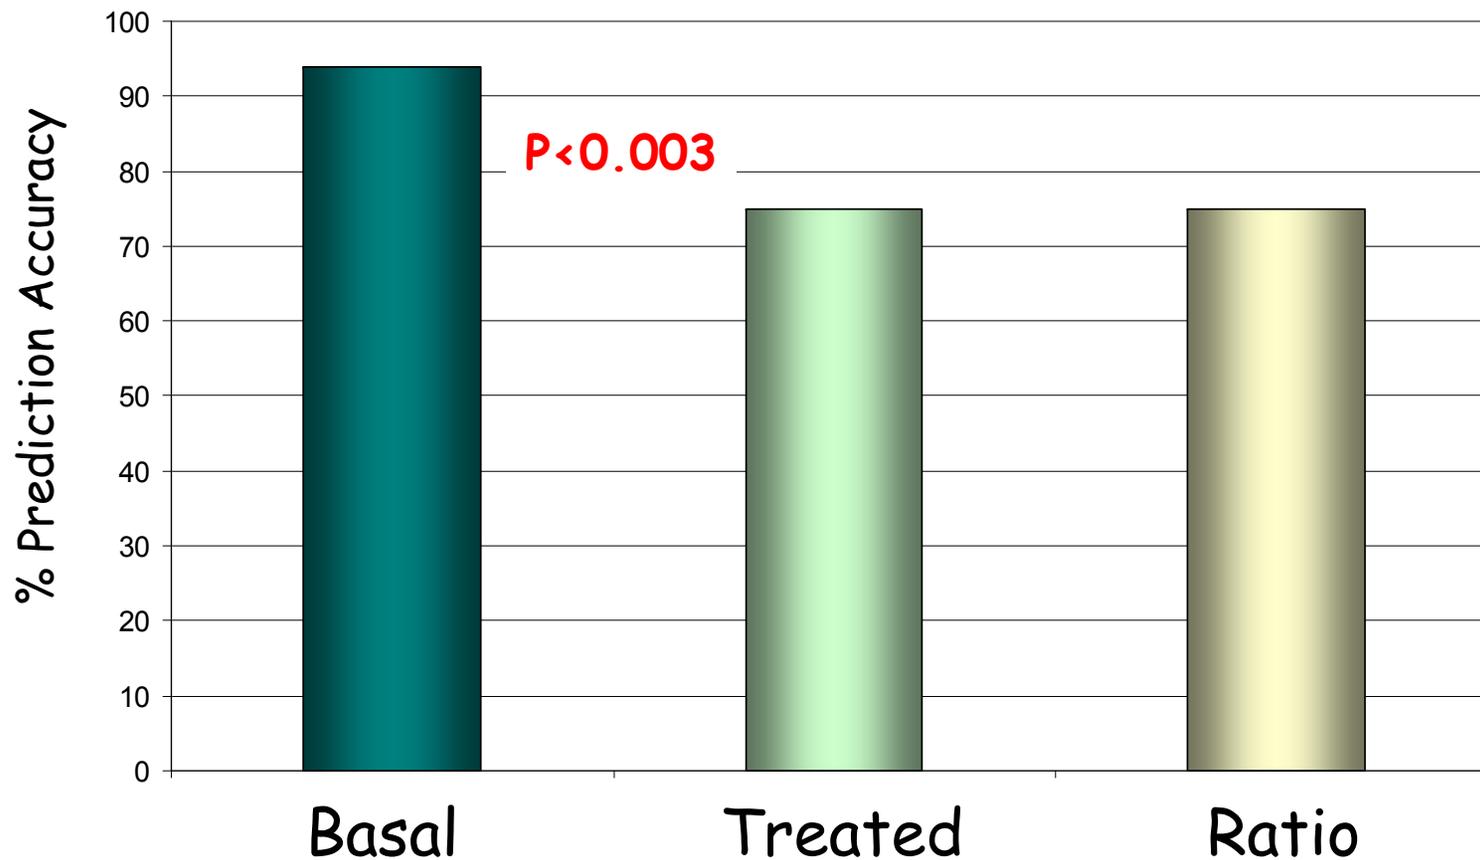

# Can the ASA gene sets PREDICT MNNG sensitivity in the Test Population?

# Basal gene expression is most predictive of sensitivity

94% accuracy

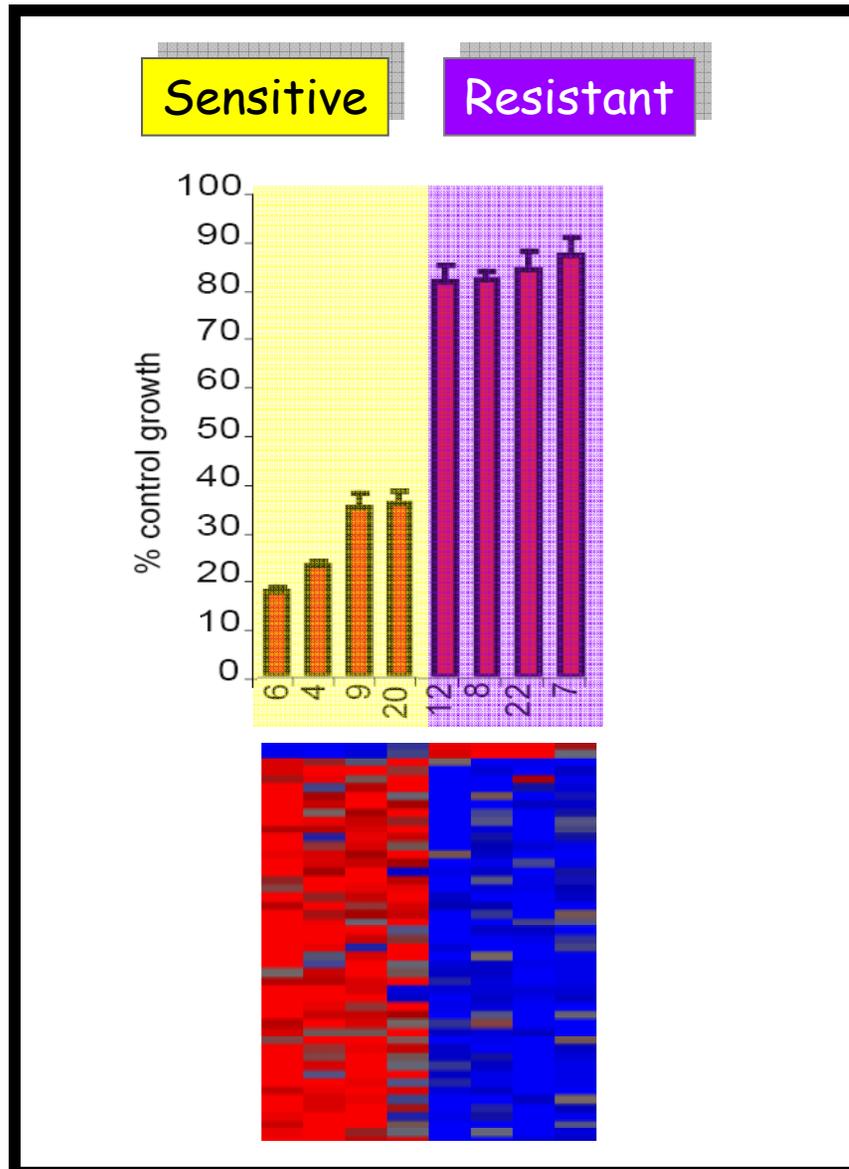

15/16 cell lines accurately predicted

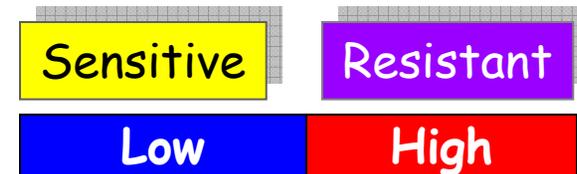

Which genes are contained in the highly predictive basal gene set?

Can we identify a potential molecular basis for the sensitivity?

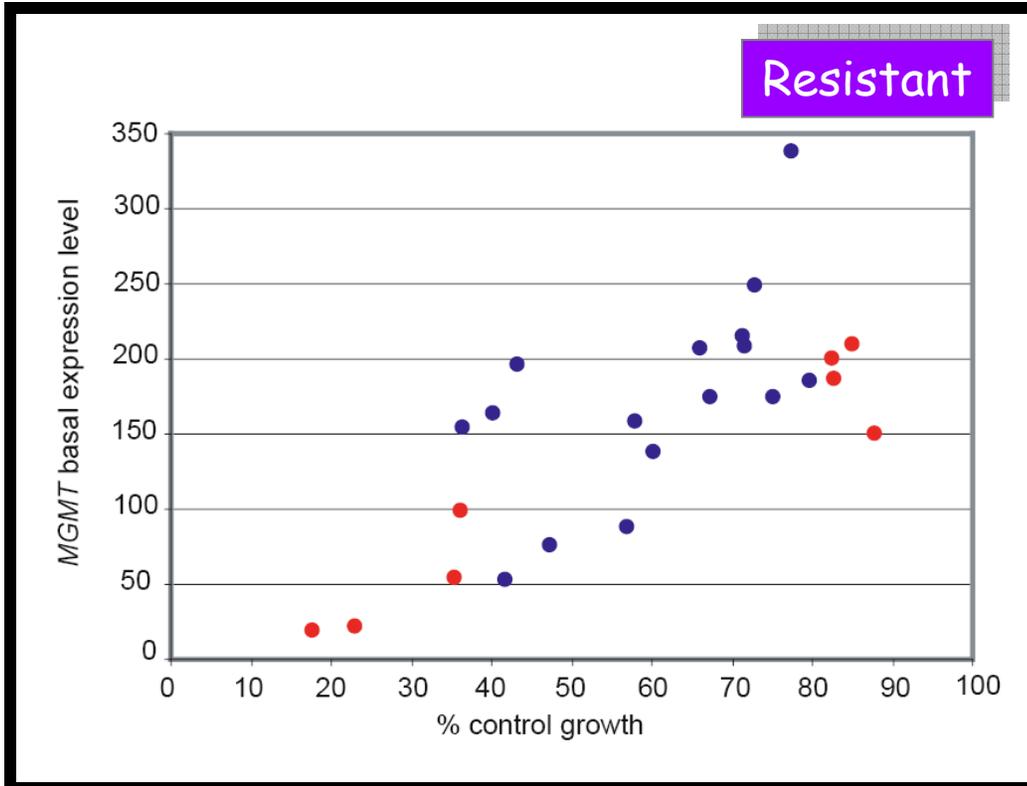

# Two expression patterns in basal set

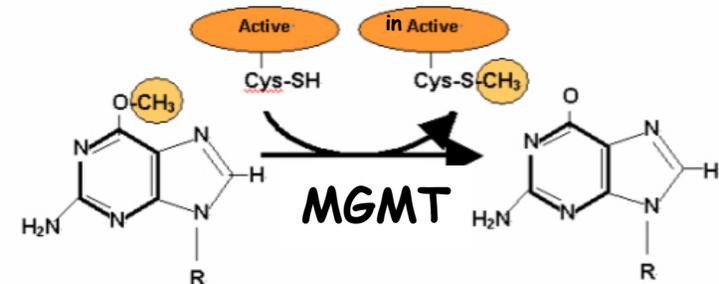

1: High expression in resistant cells

# THE most significant positive association of *MGMT* expression with low sensitivity

Unsupervised analysis uncovers  
DNA repair protein  
known to repair  
MNNG-induced damage

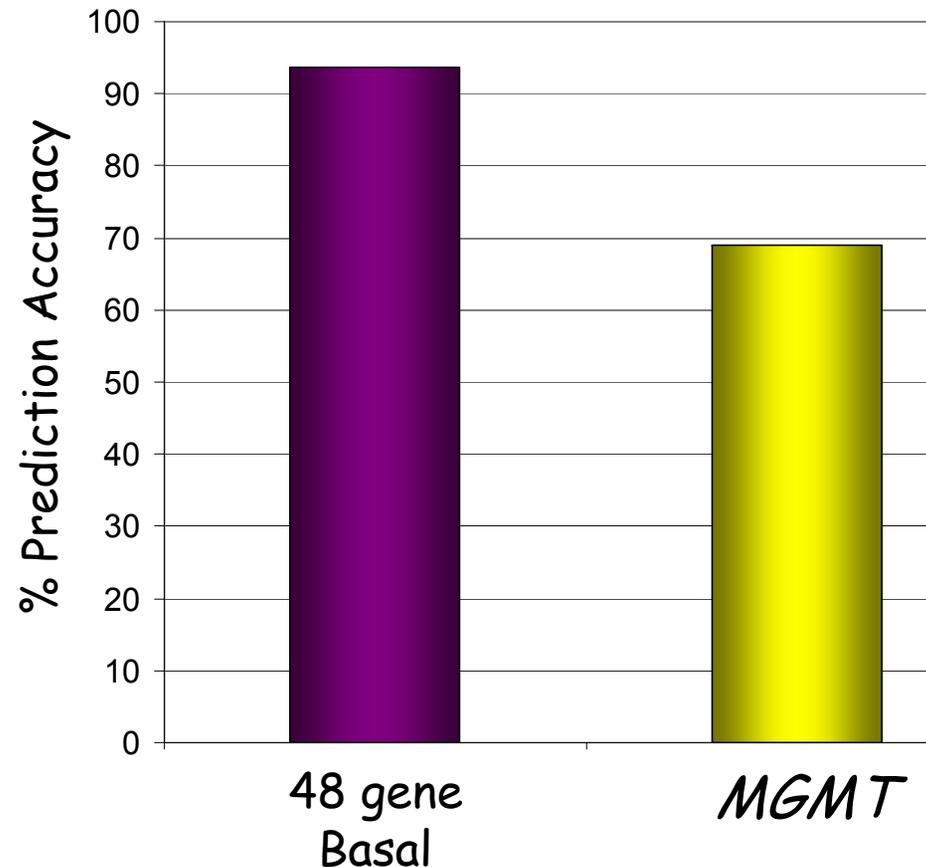

*MGMT* activity known to vary among individuals

*MGMT* expression associated with resistance to certain chemotherapeutics

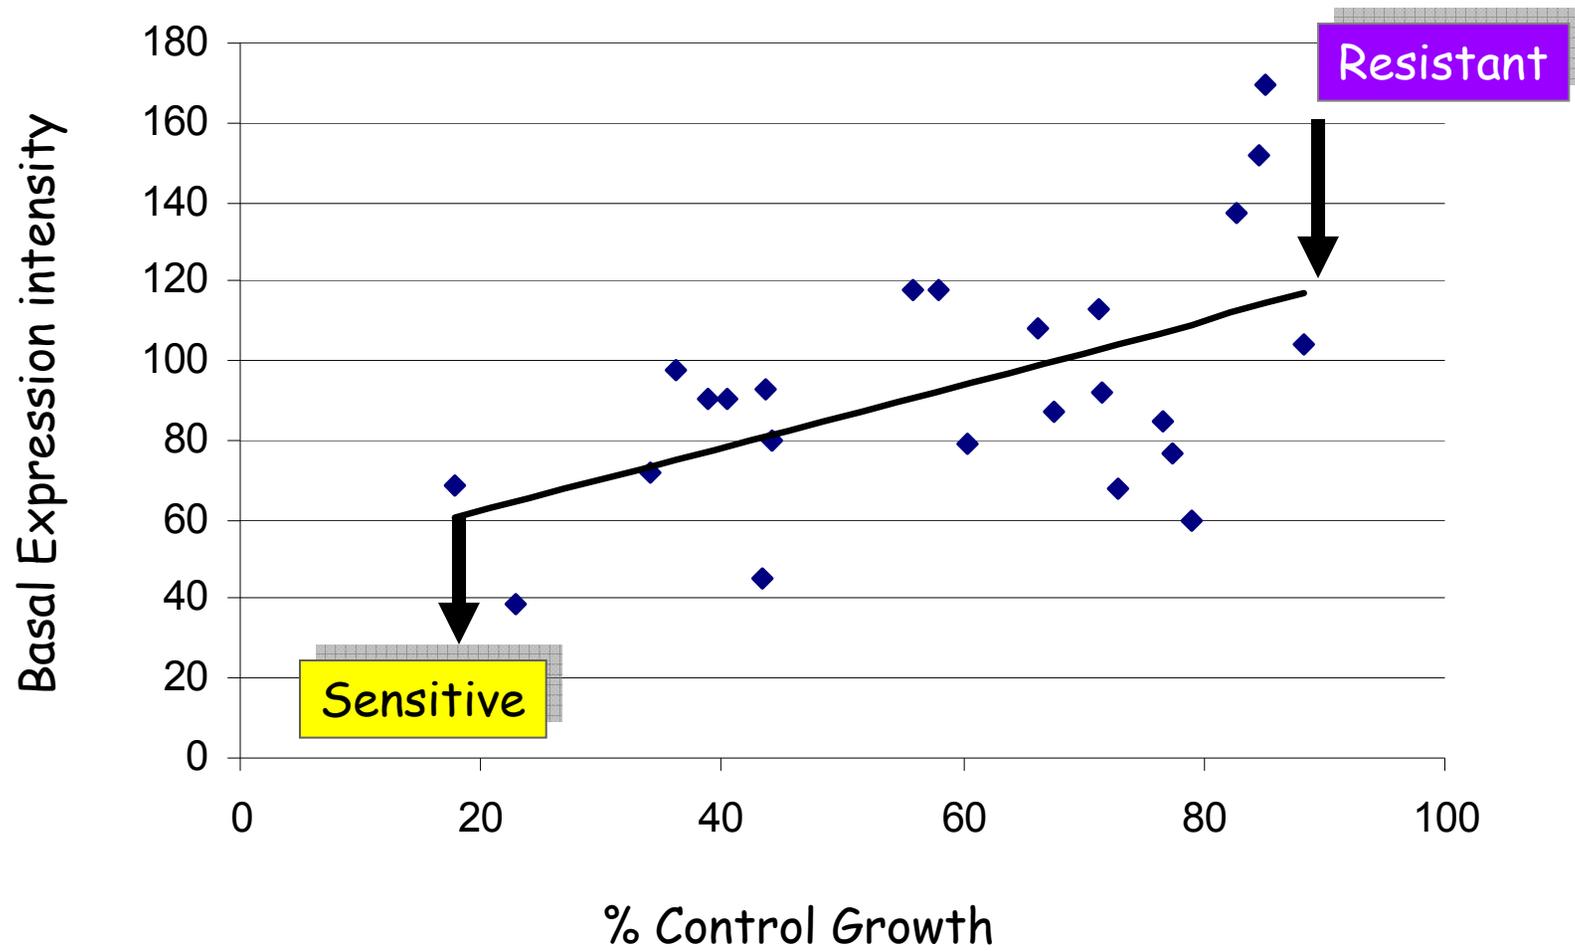

Is the existence of *MGMT* in the basal set the sole reason for high prediction??

The Basal gene set is a better predictor of alkylation sensitivity than *MGMT* alone

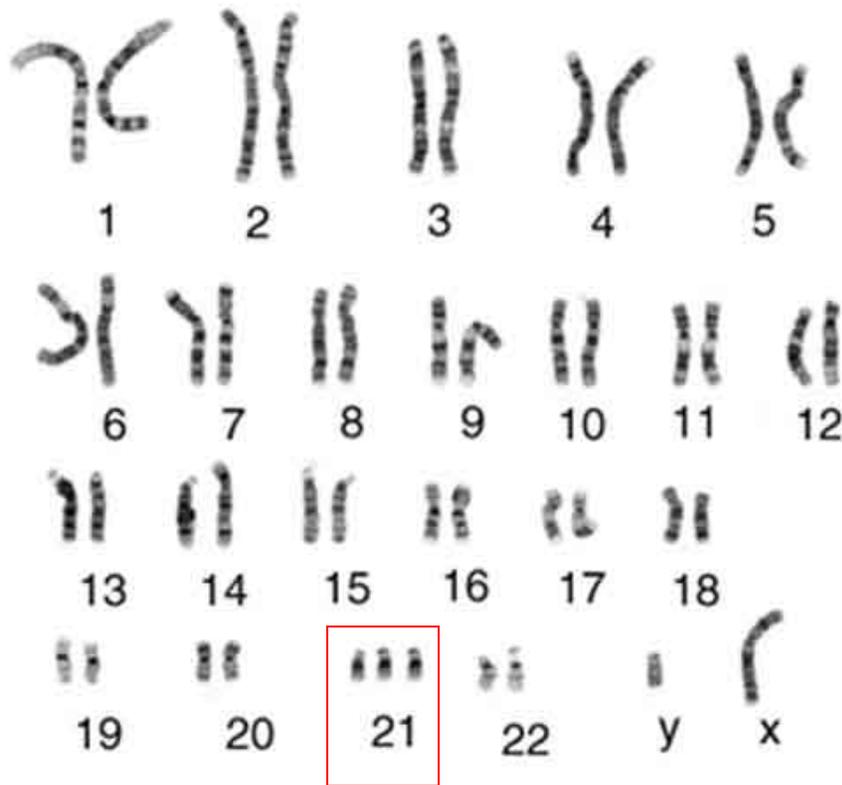

*MGMT* silencing is used as prognostic indicator of successful alkylation chemotherapy for glioblastoma-and only gene set member known to repair methylated DNA

# Second most significant positive association: *C21ORF56*

# Chromosome 21: Associated with Numerous Diseases

Chromosome 21 associated with disease:

Down Syndrome  
Alzheimer's  
Acute Myeloid Leukemia  
Autoimmune Disease

# *C21ORF56* shows variation in expression in CEPH cell lines
