

Cover Sheet for

ENVIRONMENTAL CHEMISTRY METHOD

Pesticide Name: Triclopyr

MRID #: 444561-09

Matrix: Water

Analysis: GC/MS

This method is provided to you by the Environmental Protection Agency's (EPA) Environmental Chemistry Laboratory (ECL). This method *is not* an EPA method but one which was submitted to EPA by the pesticide manufacturer to support product registration. EPA recognizes that the methods may be of some utility to state, tribal, and local authorities, but makes no claim of validity by posting these methods. Although the Agency reviews *all* Environmental Chemistry Methods submitted in support of pesticide registration, the ECL evaluates only about 30% of the currently available methods. Most methods perform satisfactorily but some, particularly the older methods, have deficiencies. Moreover, the print quality of the methods varies considerably because the methods originate from different sources. Therefore, the methods offered represent the best available copies.

If you have difficulties in downloading the method, or further questions concerning the methods, you may contact Elizabeth Flynt at 228-688-2410 or via e-mail at flynt.elizabeth@epa.gov.

WILLIAM H. COOPER.

THE VICTORY OF THE UNION OVER THE CONFEDERACY.

THE VICTORY OF THE UNION OVER THE CONFEDERACY.
The Union victory over the Confederacy was the result of many factors, including superior numbers, better leadership, and more resources. The Union's larger population and industrial base provided it with a greater ability to produce and supply its troops. The Union also had a more experienced and effective military leadership, particularly General Ulysses S. Grant, who was able to develop a strategy that effectively exploited the strengths of the Union's resources and manpower. The Confederacy, on the other hand, faced significant challenges due to its smaller population and limited industrial capacity. It also had less effective military leadership, particularly General Robert E. Lee, who was unable to develop a strategy that could effectively counteract the Union's strengths. The Union's superior numbers and resources allowed it to maintain a constant pressure on the Confederacy, eventually leading to its defeat. The Union's victory was also influenced by the support of the Union's population, who were willing to sacrifice and fight for their country. The Confederacy's lack of support from its own population, coupled with the Union's superior resources and leadership, ultimately led to its defeat.

Determination of Residues of Triclopyr, 3,5,6-Trichloro-2-pyridinol,
and 2-Methoxy-3,5,6-trichloropyridine in Water
by Capillary Gas Chromatography with Mass Selective Detection

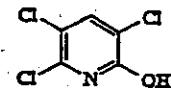

E. L. Olbending
North American Environmental Chemistry Laboratory
DowElanco
Indianapolis, Indiana 46268-1033

A. Scope

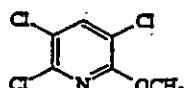

This method is applicable for the quantitative determination of residues of triclopyr ((3,5,6-trichloro-2-pyridinyl)oxy)acetic acid) and its metabolites, 3,5,6-trichloro-2-pyridinol (3,5,6-TCP), and 2-methoxy-3,5,6-trichloropyridine (2-MP) in water over the concentration range 0.10-10.0 ng/mL with a validated limit of quantitation of 0.10 ng/mL.

Triclopyr
CAS No. 55355-06-3

3,5,6-TCP
CAS No. 6515-38-4

2-MP
CAS No. 31557-34-3

B. Principle

Residues of triclopyr and its metabolites are extracted from acidified water using 1-chlorobutane. The 1-chlorobutane is concentrated to less than 1 mL, and an acetone solution containing fluoroypyrr analogs as internal standards is added. The sample is then derivatized with *N*-methyl-*N*-(tert-butyldimethylsilyl)-trifluoroacetamide (MTBSTFA) to form the tert-butyldimethylsilyl (TBDMS) derivatives of triclopyr and 3,5,6-TCP. The sample is then analyzed by capillary gas chromatography with mass selective detection (GC/MSD).

C. Safety Precautions

1. Each analyst must be acquainted with the potential hazards of the reagents, products, and solvents used in this method before commencing laboratory work. SOURCES OF INFORMATION INCLUDE: MATERIAL SAFETY DATA SHEETS, LITERATURE, AND OTHER RELATED DATA. Safety information on non-DowElanco products should be obtained from the container label or from the supplier. Disposal of reagents, reagents, and solvents must be in compliance with local, state, and federal laws and regulations.
2. Acetone and 1-chlorobutane are flammable and should be used in well-ventilated areas away from ignition sources.
3. Hydrochloric acid is corrosive and can cause severe burns. It is imperative that proper eye and personal protection equipment be worn when handling these reagents.

 - a. triclopyr ((3,5,6-trichloro-2-pyridinyl)oxy)acetic acid)
 - b. 3,5,6-trichloro-2-pyridinol (3,5,6-TCP)
 - c. 2-methoxy-3,5,6-trichloropyridine (2-MP)
 - d. fluoroxypr ((4-amino-3,5-dichloro-6-fluoro-2-pyridinyl)oxy)acetic acid)
 - e. 4-amino-3,5-dichloro-6-fluoro-2-pyridinol (fluoroxypr-DCP)
 - f. 4-amino-3,5-dichloro-6-fluoro-2-methoxypyridine (fluoroxypr-MP)

Obtain from Test Substance Coordinator, DowElanco, 9330 Zionsville Road, Building 306/A1, Indianapolis, IN 46268-1053.

G. Preparation of Standards

1. Preparation of Spiking Solutions/Calibration Standards

- a. Weigh 0.1000 g of triclopyr analytical standard and quantitatively transfer to a 100-mL volumetric flask. Dilute to volume with acetone to obtain a 1000- μ g/mL stock solution.
- b. Weigh 0.1000 g of 3,5,6-trichloro-2-pyridinol analytical standard and quantitatively transfer to a 100-mL volumetric flask. Dilute to volume with acetone to obtain a 1000- μ g/mL stock solution.
- c. Weigh 0.1000 g of 2-methoxy-3,5,6-trichloropyridine analytical standard and quantitatively transfer to a 100-mL volumetric flask. Dilute to volume with acetone to obtain a 1000- μ g/mL stock solution.

Effective Date: April 11, 1996

GRM 95.18

- d. Pipet 20.0 mL of each of the stock solutions in Sections G.1.a.-c. into a single 200-mL volumetric flask and adjust to volume with acetone to obtain a solution containing 100.0 µg/mL of each compound.
- e. Prepare solutions for spiking water samples by diluting the solution from Section G.1.d with acetone as follows:

Aliquot of Initial Sln. µL	Final Sln. Volume mL	Spiking Sln. Final Conc. ng/mL	Equivalent Sample Conc. ^a ng/mL
12.5	200	6.25	0.050
25.0	200	12.5	0.100
50.0	200	25.0	0.200
100	200	50.0	0.400
250	200	125	1.00
500	200	250	2.00
1000	200	500	4.00
2500	200	1250	10.0

^a The equivalent sample concentration is based on fortifying a 25.0-mL water sample with 200 µL of spiking solution.

- f. Prepare calibration standards by dispensing 200 µL of the solutions from Section G.1.e. into 12-mL vials containing 0.5 mL of 1-chlorobutane and derivatizing according to the procedure described in Section I.II.k.-a. The concentration range of these calibration standards is from 1.25-250 ng/mL.

Chemical structures of the underivatized and derivatized triclopyr, 3,5,6-TCP, and 2-MP are shown in Figure 1.

2. Preparation of Internal Standard Solution

- a. Weigh 0.1000 g of fluroxypyr analytical standard and quantitatively transfer to a 100-mL volumetric flask. Dilute to volume with acetone to obtain a 1000-µg/mL stock solution.
- b. Weigh 0.1000 g of 4-amino-3,5-dichloro-6-fluoro-2-pyridinol analytical standard and quantitatively transfer to a 100-mL volumetric flask. Dilute to volume with acetone to obtain a 1000-µg/mL stock solution.
- c. Weigh 0.1000 g of 4-amino-3,5-dichloro-6-fluoro-2-methoxypyridine analytical standard and quantitatively transfer to a 100-mL volumetric flask. Dilute to volume with acetone to obtain a 1000-µg/mL stock solution.
- d. Pipet 20.0 mL of each of the stock solutions in Sections G.2.a.-c. into a single 200-mL volumetric flask and adjust to volume with acetone to obtain a solution containing 100.0 µg/mL of each compound.
- e. Pipet 25.0 mL of the solution in Section G.2.d. into a 200-mL volumetric flask and adjust to volume with acetone to obtain a mixture containing 12.5 µg/mL of each compound.

Chemical structures of the underivatized and derivatized fluroxypyr, fluroxypyr-DCP, and fluroxypyr-MP are shown in Figure 2.

Effective Date: April 11, 1996

E. Gas Chromatography/Mass Spectrometry

1. Column

Connect the guard column (Section E.2) to the capillary column (Section E.1.) using a Press-Tight column connector (Section E.3.). Install the splitless column inlet sleeve (Section E.11.) and capillary column assembly in the split/splitless injection port of the GC/MSD following the manufacturer's recommended procedures.

2. Typical Operating Conditions

Instrumentation:

Triclopyr-TBDMS	<i>m/z</i> 312 (quantitation) <i>m/z</i> 254, 256, 314 (confirmation) (Section K.2)
3,5,6-TCP-TBDMS	<i>m/z</i> 254 (quantitation) <i>m/z</i> 256 (confirmation)
2-MP	<i>m/z</i> 211 (quantitation) <i>m/z</i> 182, 210, 212, 213 (confirmation) (Section K.2)
Fluoroxypyrr-TBDMS	<i>m/z</i> 311 (internal standard for triclopyr-TBDMS)
Fluoroxypyrr-DCP-TBDMS	<i>m/z</i> 253 (internal standard for 3,5,6-TCP-TBDMS)
Fluoroxypyrr-MP	<i>m/z</i> 210 (internal standard for 2-MP)

Dwell Time:

75 ms

Mass spectra of the above triclopyr and fluoroxypyrr compounds are shown in Figures 3-8, respectively.

3. Calibration Curves

Typical calibration curves for the determination of triclopyr, 3,5,6-TCP, and 2-MP are shown in Figures 9-11, respectively.

4. Typical Chromatograms

Typical chromatograms of a standard, control sample, and a 0.10- μ g/mL recovery sample for the determination of triclopyr, 3,5,6-TCP, and 2-MP in water are illustrated in Figures 12-20, respectively. None of the control samples in the method validation study contained interference peaks at the retention times of the analytes or internal standards.

L Determination of Recovery of Triclopyr and Metabolites from Water**1. Preparation of Recovery Samples**

- a. Pipet 25.0-mL portions of the control water sample into a series of 45-mL vials.
- b. For preparing fortified samples, use some of the samples as controls and fortify the remaining samples by adding 200- μ L aliquots of the appropriate spiking solutions (Section G.1.e.) to obtain concentrations ranging from 0.10 to 10.0 μ g/mL. Also analyze a sample consisting of only distilled/deionized water to serve as a reagent blank.
- c. Add 1.0 mL of 2.0 N hydrochloric acid, 10 g of sodium chloride (enough to saturate the solution), and 5.0 mL of 1-chlorobutane to the sample vial.
- d. Cap the vial with a PTFE-lined cap, and shake the sample for 30 minutes on a reciprocating shaker at approximately 180 excursions/minute.
- e. Centrifuge the sample vial for 5 minutes at 2500 rpm.
- f. Transfer the 1-chlorobutane (top) layer into a clean 12-mL vial. (Note L.5.)

Effective Date: April 11, 1996

CRM 95.18

- g. Add an additional 5.0 mL of 1-chlorobutane to the sample vial. Cap the vial, and shake the sample for 30 minutes on a reciprocating shaker at approximately 180 excursions/minute.
- h. Centrifuge the sample vial for 5 minutes at 2500 rpm.
- i. Combine the 1-chlorobutane layer from Step L1.h. with the 1-chlorobutane extract from Step L1.f. and mix thoroughly. (Note L5.)
- j. Concentrate the solution from Step L1.i. to less than 0.8 mL (but not to dryness) using an N-Evap evaporator. (Note L2.)
- k. Add 100 μ L of the internal standard solution (Section G.1.a.) and 100 μ L of MTBSTFA derivatizing reagent to the sample vial.
- l. Adjust the volume in the sample vial to 1.0 mL with 1-chlorobutane and firmly seal with a FTE-lined cap. Vortex the sample for 5-10 seconds, and then sonicate the sample for 5-10 seconds.
- m. Place the sample vial in an oven set at 60 °C and allow the mixture to react for 60 minutes.
- n. Remove the sample vial from the oven and allow the reaction mixture to cool to room temperature.
- o. Transfer the sample to a 2-mL autosampler vial and seal the vial with a cap.
- p. Analyze the calibration standards from Section G.1.e. and samples by capillary gas chromatography/mass spectrometry as described in Section H.2. Determine the suitability of the chromatographic system using the following performance criteria:
 - (1) Standard curve linearity: Determine that the correlation coefficient equals or exceeds 0.99 for the least squares equation which describes the detector response as a function of standard curve concentration. If power regression is used, the power exponent should be between 0.90-1.10.
 - (2) Peak resolution: Visually determine that sufficient resolution has been achieved for the analytes and internal standards relative to background interferences.
 - (3) Appearance of chromatograms: Visually determine that the chromatograms resemble those shown in Figures 12-20 with respect to peak response, baseline noise, and background interference. Visually determine that a minimum signal-to-noise ratio of 5:1 has been attained for each analyte in the 2.50- μ g/mL calibration standard (equivalent to 0.10 ng/mL in water samples).

Effective Date: April 11, 1996

GRM 95.18

2. Calculation of Percent Recovery

- a. Inject the series of calibration standards described in Section G.1.f. and determine the peak areas for the analytes and internal standards as indicated below.

Triclopyr-TBDMS	<i>m/z</i> 312 (quantitation), <i>m/z</i> 256 (confirmation)
3,5,6-TCP-TBDMS	<i>m/z</i> 254 (quantitation), <i>m/z</i> 256 (confirmation)
2-MP	<i>m/z</i> 211 (quantitation), <i>m/z</i> 182 (confirmation)
Fluroxypyr-TBDMS	<i>m/z</i> 311 (internal standard for triclopyr-TBDMS)
Fluroxypyr-DCP-TBDMS	<i>m/z</i> 253 (internal standard for 3,5,6-TCP-TBDMS)
Fluroxypyr MP	<i>m/z</i> 210 (internal standard for 2-MP)

- b. For each standard, calculate each analyte's confirmation ratio. Use the average confirmation ratio for each analyte to confirm the presence of the analyte in the water samples.

For example, using the data for triclopyr from Figure 12:

$$\text{Confirmation Ratio} = \frac{\text{peak area of confirmation ion}}{\text{peak area of quantitation ion}}$$

$$\text{Confirmation Ratio} = \frac{\text{peak area at } m/z \text{ 256}}{\text{peak area at } m/z \text{ 312}}$$

$$\text{Confirmation Ratio} = \frac{2259}{1746}$$

$$\text{Confirmation Ratio} = 1.2938$$

Confirmation of the presence of the analyte is indicated when the confirmation ratio for the sample is within the range of $\pm 15\%$ of the average found for the standards.

- c. For each standard, calculate each analyte's quantitation ratio.

For example, using the data for triclopyr from Figure 12:

$$\text{Quantitation Ratio} = \frac{\text{peak area of quantitation ion}}{\text{peak area of internal standard ion}}$$

$$\text{Quantitation Ratio} = \frac{\text{peak area at } m/z \text{ 312}}{\text{peak area at } m/z \text{ 311}}$$

$$\text{Quantitation Ratio} = \frac{1746}{475879}$$

$$\text{Quantitation Ratio} = 0.00367$$

Effective Date: April 11, 1996

- d. Prepare a standard curve for each analyte by plotting the equivalent analyte concentration (as ng/mL) on the abscissa (x-axis) and the respective quantitation ratio on the ordinate (y-axis) as shown in Figures 9-11. Using regression analysis, determine the equation for the curve with respect to the abscissa.

For example, using power regression (I) with the triclopyr data from Figure 9:

$$Y = \text{constant} \times X^{(\text{exponent})}$$
$$X = \left(\frac{Y}{\text{constant}} \right)^{1/\text{exponent}}$$
$$\text{Triclopyr Conc. (ng/mL)} = \left(\frac{\text{triclopyr quantitation ratio}}{\text{constant}} \right)^{1/\text{exponent}}$$
$$\text{Triclopyr Conc. (ng/mL)} = \left(\frac{\text{triclopyr quantitation ratio}}{0.03458} \right)^{1/0.96175}$$

- e. Determine the gross concentration in each recovery sample by substituting the quantitation ratio obtained into the above equation and solving for the concentration.

For example, using the triclopyr data from Figure 14:

$$\text{Triclopyr Conc. (gross ng/mL)} = \left(\frac{\text{triclopyr quantitation ratio}}{0.03458} \right)^{1/0.96175}$$
$$\text{Triclopyr Conc. (gross ng/mL)} = \left(\frac{0.00392}{0.03458} \right)^{1/0.96175}$$
$$\text{Triclopyr Conc. (gross ng/mL)} = 0.104 \text{ ng/mL}$$

- f. Determine the net concentration in each recovery sample by subtracting any apparent triclopyr concentration in the control sample from that of the gross triclopyr concentration in the recovery sample.

For example, using the triclopyr data from Figures 13 and 14:

$$\text{Triclopyr Conc. (net ng/mL)} = \text{Triclopyr Conc. (gross ng/mL)} - \text{Triclopyr Conc. (control ng/mL)}$$
$$\text{Triclopyr Conc. (net ng/mL)} = 0.104 \text{ ng/mL} - 0.000 \text{ ng/mL}$$
$$\text{Triclopyr Conc. (net ng/mL)} = 0.104 \text{ ng/mL}$$

Effective Date: April 11, 1996

GRM 95.18

- g. Determine the percent recovery by dividing the net concentration of each recovery sample by the theoretical concentration added.

$$\text{Recovery} = \frac{\text{Concentration Found}}{\text{Concentration Added}} \times 100\%$$

$$\text{Recovery} = \frac{0.104 \text{ ng/mL}}{0.100 \text{ ng/mL}} \times 100\%$$

$$\text{Recovery} = 104\%$$

I. Determination of Triclopyr and Metabolites in Water

1. Prepare reagent blank, control, recovery, and treated samples as described in Section I.1.
2. Prepare a standard calibration curve for triclopyr, 3,5,6-TCP, and 2-MP and determine the percent recovery for each analyte as described in Section I.2.
3. Determine the gross concentration of each analyte in each treated sample by substituting the quantitation ratio obtained into the equation for the standard calibration curve, and calculating the uncorrected residue result as described in Section I.2.c.
4. For those analyses that require correction for method recovery, use the average recovery of all the recovery samples to correct for method efficiency. The following procedure is used:
 - a. Determine the gross analyte concentrations in the water sample as described in Section I.2.c.
 - b. Determine the corrected analyte concentrations in the water sample as follows:

$$\text{Triclopyr Conc. (corrected ng/mL)} = \text{Triclopyr Conc. (gross ng/mL)} \times \left(\frac{100}{\text{Average Percent Recovery}} \right)$$

$$\text{Triclopyr Conc. (corrected ng/mL)} = 0.104 \text{ ng/mL} \times \frac{100}{101}$$

$$\text{Triclopyr Conc. (corrected)} = 0.103 \text{ ng/mL}$$

Effective Date: April 11, 1996

K. Results and Discussion

1. Method Validation

a. Recovery Levels and Precision

A method validation study was conducted to determine the recovery levels and the precision of the method for the determination of triclopyr, 3,5,6-TCP, and 2-MP in water. The results are summarized in Tables I-III.

Recovery values of triclopyr from samples of water fortified over the concentration range of 0.10 to 10.0 ng/mL averaged 101% with one standard deviation equal to 7% (Table I). Recovery values of 3,5,6-TCP from samples of water fortified over the concentration range of 0.10 to 10.0 ng/mL averaged 91% with one standard deviation equal to 7% (Table II). Recovery values of 2-MP from samples of water fortified over the concentration range of 0.10 to 10.0 ng/mL averaged 93% with one standard deviation equal to 6% (Table III).

b. Standard Curve Linearity

For the power least squares regression equations describing the detector response as a function of the standard calibration curve concentrations, the correlation coefficients (r^2) were greater than 0.993 for all three analytes, while the power exponents were between 0.96 and 1.03.

c. Calculated Limits of Quantitation and Detection

Following established guidelines (2), the limits of quantitation (LOQ) and detection (LOD) were calculated using the standard deviation from the 0.10-ng/mL recovery results. The LOQ was calculated as ten times the standard deviation ($10s$), and the LOD was calculated as three times the standard deviation ($3s$) of the results of the analysis of ten samples. The results are tabulated in Tables I-III.

The calculated LOQ ranged from 0.046-0.060 ng/mL for the three analytes, which is lower than the targeted method LOQ of 0.10 ng/mL. Results should not be quantified, however, at levels below which no recovery samples have been analyzed.

In a similar fashion, the calculated LOD ranged from 0.014-0.018 ng/mL for the three analytes. However, since the lowest level of fortification for recovery samples was 0.05 ng/mL, the method LOD is considered to be 0.05 ng/mL. In actual residue samples, numerical results should be reported as less than the LOQ (<0.10 ng/mL) for residues that are above the LOD but less than the validated LOQ.

2. Confirmation of Residue Identity

Confirmation of the presence of residues is described in Section I.2.b. For the three analytes, confirmation is by comparison of the retention time (gas chromatography) as well as the peak area ratios resulting from selected ion monitoring (mass spectrometry). Confirmation of the presence of the analytes is indicated when the retention times match those of the standards and the confirmation ratio is in the range of $\pm 15\%$ of the average found for the standards. If additional confirmation is required beyond that discussed in this method, the mass spectra of triclopyr-TEDMS and triclopyr-MP contain additional ions (Section H.2.) that may be used for confirmation.

Effective Date: April 11, 1996

GRM 95.18

3. Assay Time

A typical analytical run consists of a minimum of four standards encompassing the expected range of sample concentrations, distilled/deionized water serving as a reagent blank, a control (a non-fortified sample), a minimum of two fortified controls (one of which must be at the LOQ), and forty samples. This typical analytical run can be prepared in approximately eight hours, followed by the chromatographic analysis.

There are several acceptable "stopping points" in the method, where sample preparation (Section I) may be suspended without deleterious effects on the sample analysis. These are indicated below:

- a. Step L1.c
- b. Step L1.i
- c. Step L1.n

If the samples are to be stored overnight, the vials should be capped with PTFE-lined caps.

L. Notes

1. Equipment, glassware, materials, reagents, and chemicals considered to be equivalent to those specified may be substituted with the understanding that their performance must be confirmed by appropriate tests. Common laboratory supplies are assumed to be readily available and are, therefore, not listed.
2. The N-Evac evaporator should be set at a water bath temperature of 30 °C and a nitrogen flow rate of approximately 200 mL/min. At elevated water bath temperatures, the 3,3,6-TCP and 2-MP may volatilize, thereby reducing recoveries.
3. The filters are used in the carrier gas supply lines to purify the helium entering the gas chromatograph.
4. Several tuning, or calibration, options are available for the Model 597X series of MSDs. The "Maximum Sensitivity Autotune" feature was found to consistently yield approximately 5-10 times the sensitivity compared to that of the "Standard Autotune".
5. In transferring the 1-chlorobutane layer, it is important not to remove any water from the lower layer. Contaminating the 1-chlorobutane with water will have deleterious effects on the derivatization and subsequent GC/MSD analysis.

^a SN14390104 — Domestic well in Little Rock, AR.

^b SN14420701 — Rice paddy in Opelousas, LA.

^c SN14421501 — Rice paddy in Little Rock, AR.

^d SN15082701 — Municipal supply from Zionsville, IN.

^e SN15082702 — Oak Ridge pond in Zionsville, IN.

^f Tap Water — Municipal supply from Indianapolis, IN.

^g SN15082703 — DowElanco pond in Indianapolis, IN.

^h NA = not applicable. The residue was below the 0.10- μ g/ml limit of quantitation.

ⁱ Calculated limit of detection.

^j Calculated limit of quantitation.

^k These samples were inadvertently dried during sample preparation. The results were not used in the statistical calculations.
