# DOCUMENTATION OF ENVIRONMENTAL INDICATOR DETERMINATION Interim Final 2/5/99 RCRA Corrective Action Environmental Indicator (EI) RCRIS code (CA725) Current Human Exposures Under Control

Facility Name:	University of Virginia
Facility Address:	P.O. Box 3425, Charlottesville, VA 22903
Facility EPA ID #:	VAD 00 082 0712

1. Has **all** available relevant/significant information on known and reasonably suspected releases to soil, groundwater, surface water/sediments, and air, subject to RCRA Corrective Action (e.g., from Solid Waste Management Units (SWMU), Regulated Units (RU), and Areas of Concern (AOC)), been **considered** in this EI determination?

- If no re-evaluate existing data, or
- - \_\_\_\_\_ if data are not available skip to #6 and enter"IN" (more information needed) status code.

# BACKGROUND

### Definition of Environmental Indicators (for the RCRA Corrective Action)

Environmental Indicators (EI) are measures being used by the RCRA Corrective Action program to go beyond programmatic activity measures (e.g., reports received and approved, etc.) to track changes in the quality of the environment. The two EI developed to-date indicate the quality of the environment in relation to current human exposures to contamination and the migration of contaminated groundwater. An EI for non-human (ecological) receptors is intended to be developed in the future.

### Definition of "Current Human Exposures Under Control" EI

A positive "Current Human Exposures Under Control" EI determination ("YE" status code) indicates that there are no "unacceptable" human exposures to "contamination" (i.e., contaminants in concentrations in excess of appropriate risk-based levels) that can be reasonably expected under current land- and groundwater-use conditions (for all "contamination" subject to RCRA corrective action at or from the identified facility (i.e., site-wide)).

### **Relationship of EI to Final Remedies**

While Final remedies remain the long-term objective of the RCRA Corrective Action program the EI are near-term objectives which are currently being used as Program measures for the Government Performance and Results Act of 1993, GPRA). The "Current Human Exposures Under Control" EI are for reasonably expected human exposures under current land- and groundwater-use conditions ONLY, and do not consider potential future land- or groundwater-use conditions or ecological receptors. The RCRA Corrective Action program's overall mission to protect human health and the environment requires that Final remedies address these issues (i.e., potential future human exposure scenarios, future land and groundwater uses, and ecological receptors).

### **Duration / Applicability of EI Determinations**

EI Determinations status codes should remain in RCRIS national database ONLY as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).

2. Are groundwater, soil, surface water, sediments, or air **media** known or reasonably suspected to be **"contaminated"**<sup>1</sup> above appropriately protective risk-based "levels" (applicable promulgated standards, as well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA Corrective Action (from SWMUs, RUs or AOCs)?

	Yes	No	<u>?</u>	Rationale / Key Contaminants
Groundwater	Х			See Comment Below
Air (indoors) <sup>2</sup>		Х		
Surface Soil (e.g., <2 ft)		Х		
Surface Water		Х		
Sediment		Х		
Subsurf. Soil (e.g., >2 ft)	Х			See Comment Below
Air (outdoors)		Х		

If no (for all media) - skip to #6, and enter "YE," status code after providing or citing
appropriate "levels," and referencing sufficient supporting documentation demonstrating that these "levels" are not exceeded.

X If yes (for any media) - continue after identifying key contaminants in each "contaminated" medium, citing appropriate "levels" (or provide an explanation for the determination that the medium could pose an unacceptable risk), and referencing supporting documentation.

If unknown (for any media) - skip to #6 and enter "IN" status code.

#### **Rationale and Reference(s):**

The University of Virginia (UVA) founded in 1819 by Thomas Jefferson, is a state-supported institution that supports research and scholarship in many fields. Based on an initial facility wide assessment two areas were identified for further study. These areas are identified as SWMU 16 and the Hillside disposal Area (HDA). Field work for an investigation of environmental media was conducted in September 2000. Analytical results identified the following media as being contaminated above protective risk-based levels.

<u>Groundwater</u> - Analytical laboratory results from the September 2000 investigation identified Bis(2-Ethylhexyl)phthalate (77 ppb), which exceeds the Region 3 Tapwater RBC screening levels. (There is no MCL for Bis(2-Ethylhexyl)phthalate).

<u>Subsurface Soils</u> - Analytical laboratory results from the September 2000 investigation identified the following constituents, which exceed the Region 3 Residential Soils RBC screening level; Arsenic (21 ppm), Iron (79,000 ppm), Lead (854 ppm), Thallium (13.5 ppm), Aroclor 1254 (300 ppb), Benz(a)anthracene (3200 ppb), Benzo(a)pyrene (2900 ppb), Benzo(b)fluoranthene (3400 ppb), Indeno(1,2,3-cd)pyrene (1300 ppb).

For more information on the investigation of SWMU 16 and the HDA at UVA, please see the report entitled "Source Characterization Investigation of Two Former Waste Disposal Sites at Observatory Hill, University of Virginia" dated January 2001

#### Footnotes:

<sup>1</sup> "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based "levels" (for the media, that identify risks within the acceptable risk range).

<sup>2</sup>Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

3. Are there **complete pathways** between "contamination" and human receptors such that exposures can be reasonably expected under the current (land- and groundwater-use) conditions?

#### Summary Exposure Pathway Evaluation Table

#### Potential Human Receptors (Under Current Conditions)

"Contaminated" Media Reside	ents	Workers	Day-Care	Construction	Trespassers	Recreation	$Food^3$
Groundwater	No	No	No	No	No	No	No
Air (indoors)							
Soil (surface, e.g., <2 ft)							
Surface Water	No	No	No	No	No	Yes	No
Sediment							
Soil (subsurface e.g., >2 ft)	No	No	No	No	No	No	No
Air (outdoors)							

Instructions for Summary Exposure Pathway Evaluation Table:

1. Strike-out specific Media including Human Receptors' spaces for Media which are not "contaminated" as identified in #2 above.

2. enter "yes" or "no" for potential "completeness" under each "Contaminated" Media -- Human Receptor combination (Pathway).

Note: In order to focus the evaluation to the most probable combinations some potential "Contaminated" Media - Human Receptor combinations (Pathways) do not have check spaces ("\_\_\_\_"). While these combinations may not be probable in most situations they may be possible in some settings and should be added as necessary.

If no (pathways are not complete for any contaminated media-receptor combination) - skip to #6, and enter "YE" status code, after explaining and/or referencing condition(s) inplace, whether natural or man-made, preventing a complete exposure pathway from each contaminated medium (e.g., use optional <u>Pathway Evaluation Work Sheet</u> to analyze major pathways).

If yes (pathways are complete for any "Contaminated" Media - Human Receptor combination) - continue after providing supporting explanation.

If unknown (for any "Contaminated" Media - Human Receptor combination) - skip to #6 and enter "IN" status code.

#### **Rationale and Reference(s):**

Groundwater: There is no current groundwater use at SWMU 16 or the HDA. Drinking water is provided by Rivanna Water and Sewer Authority to the area around the Site including all residential, commercial and UVA buildings. There are no facilities located on the areas being investigated. Groundwater is not used for growing food on these areas.

Subsurface Soil: There are no residences or facilities located on the areas being investigated. Subsurface soils are not currently accessible and are covered by approximately 2 feet of clean soil.

Direct contact with groundwater by residents or workers was determined to be an incomplete pathway because groundwater is not used for potable purposes and drinking water is provided by Rivanna Water and Sewer Authority. However, it was assumed that persons using the Site for recreational purposes could contact the groundwater after it discharges to the intermittent stream. Thus, the groundwater to surface water pathway, in which recreational users may contact contaminants of potential concern, was considered complete for current exposures.

<sup>3</sup> Indirect Pathway/Receptor (e.g., vegetables, fruits, crops, meat and dairy products, fish, shellfish, etc.)

- 4. Can the **exposures** from any of the complete pathways identified in #3 be reasonably expected to be "**significant**"<sup>4</sup> (i.e., potentially "unacceptable" because exposures can be reasonably expected to be: 1) greater in magnitude (intensity, frequency and/or duration) than assumed in the derivation of the acceptable "levels" (used to identify the "contamination"); or 2) the combination of exposure magnitude (perhaps even though low) and contaminant concentrations (which may be substantially above the acceptable "levels") could result in greater than acceptable risks)?
  - X If no (exposures can not be reasonably expected to be significant (i.e., potentially "unacceptable") for any complete exposure pathway) skip to #6 and enter "YE" status code after explaining and/or referencing documentation justifying why the exposures (from each of the complete pathways) to "contamination" (identified in #3) are not expected to be "significant."
  - If yes (exposures could be reasonably expected to be "significant" (i.e., potentially "unacceptable") for any complete exposure pathway) - continue after providing a description (of each potentially "unacceptable" exposure pathway) and explaining and/or referencing documentation justifying why the exposures (from each of the remaining complete pathways) to "contamination" (identified in #3) are not expected to be "significant."
    - If unknown (for any complete pathway) skip to #6 and enter "IN" status code

### **Rationale and Reference(s):**

The pathway identified in Question #3 is not considered to be significant since there were no constituents in surface water or sediment samples that exceeded applicable screening levels.

<sup>4</sup> If there is any question on whether the identified exposures are "significant" (i.e., potentially "unacceptable") consult a human health Risk Assessment specialist with appropriate education, training and experience.

- 5. Can the "significant" **exposures** (identified in #4) be shown to be within **acceptable** limits?
  - If yes (all "significant" exposures have been shown to be within acceptable limits) continue and enter "YE" after summarizing <u>and</u> referencing documentation justifying why all "significant" exposures to "contamination" are within acceptable limits (e.g., a site-specific Human Health Risk Assessment).
  - If no (there are current exposures that can be reasonably expected to be "unacceptable")continue and enter "NO" status code after providing a description of each potentially "unacceptable" exposure.
  - If unknown (for any potentially "unacceptable" exposure) continue and enter "IN" status code

Rationale and Reference(s):

6. Check the appropriate RCRIS status codes for the Current Human Exposures Under Control EI event code (CA725), and obtain Supervisor (or appropriate Manager) signature and date on the EI determination below (and attach appropriate supporting documentation as well as a map of the facility):

X YE - Yes, "Current Human Exposures Under Control" has been verified. Based on a review of the information contained in this EI Determination, "Current Human Exposures" are expected to be "Under Control" at the University of Virginia, (SWMU 16 and Hillside Disposal Area), EPA ID #VAD 00 082 0712, located off Fontaine Ave. (Business Rt. 29), Charlottesville, VA under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.
 NO - "Current Human Exposures" are NOT "Under Control."
