#### DOCUMENTATION OF ENVIRONMENTAL INDICATOR DETERMINATION

Interim Final 2/5/99

### RCRA Corrective Action Environmental Indicator (EI) RCRIS code (CA750)

### Migration of Contaminated Groundwater Under Control

Facility Name:	Emerson Electric Company, Brooks Instrument Division			
Facility Address:	407 West Vine Street Hatfield, PA 19440			
Facility EPA ID #:	PAD002482628			
1. Has all available relevant/significant information on known and reasonably suspected releases to the groundwater media, subject to RCRA Corrective Action (e.g., from Solid Waste Management Units [SWMU] Regulated Units [RU], and Areas of Concern [AOC]), been <b>considered</b> in this EI determination?				
	X If yes – check here and continue with #2 below.			
	If no – re-evaluate existing data, or			
	If data are not available skip to #6 and enter "IN" (more information needed) status code.			

#### **BACKGROUND**

#### **Definition of Environmental Indicators (for the RCRA Corrective Action)**

Environmental Indicators (EI) are measures being used by the RCRA Corrective Action program to go beyond programmatic activity measures (e.g., reports received and approved, etc.) to track changes in the quality of the environment. The two EI developed to-date indicate the quality of the environment in relation to current human exposures to contamination and the migration of contaminated groundwater. An EI for non-human (ecological) receptors is intended to be developed in the future.

#### Definition of "Migration of Contaminated Groundwater Under Control" EI

A positive "Migration of Contaminated Groundwater Under Control" EI determination ("YE" status code) indicates that the migration of "contaminated" groundwater has stabilized, and that monitoring will be conducted to confirm that contaminated groundwater remains within the original "area of contaminated groundwater" (for all groundwater "contamination" subject to RCRA corrective action at or from the identified facility (i.e., site-wide)).

#### **Relationship of EI to Final Remedies**

While Final remedies remain the long-term objective of the RCRA Corrective Action program the EI are near-term objectives which are currently being used as Program measures for the Government Performance and Results Act of 1993, GPRA). The "Migration of Contaminated Groundwater Under Control" EI pertains ONLY to the physical migration (i.e., further spread) of contaminated ground water and contaminants within groundwater (e.g., non-aqueous phase liquids or NAPLs). Achieving this EI does not substitute for achieving other stabilization or final remedy requirements and expectations associated with sources of contamination and the need to restore, wherever practicable, contaminated groundwater to be suitable for its designated current and future uses.

### **Duration / Applicability of EI Determinations**

EI Determinations status codes should remain in RCRIS national database ONLY as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).

Page 2

2.	"leve	"levels" (i.e., applicable promulgated standards, as well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA Corrective Action, anywhere at, or from, the facility			
	X	If yes - continue after identifying key contaminants, citing appropriate "levels," and referencing supporting documentation.			
		If no - skip to #8 and enter "YE" status code, after citing appropriate "levels," and referencing supporting documentation to demonstrate that groundwater is not "contaminated."			
		If unknown - skip to #8 and enter "IN" status code.			

#### Rationale and Reference(s):

Groundwater at the facility is contaminated with trichloroethene (TCE) and tetrachloroethene (PCE). Concentrations of TCE and PCE exceed EPA Maximum Contaminant Levels (MCLs) primarily in two source areas: near the maintenance shed/garage to the north of the main building (MW-2 and MW-3 monitor this area) and underneath and outside the southwestern side of the main building (MW-5 and RW-2 monitor this area).

Annual groundwater monitoring reports provide data tracking the changes in concentrations of solvent compounds at monitoring wells at the facility and downgradient locations. Analytical results for VOCs from MW-1, MW-2, and MW-3 have been historically used for monitoring the progress of groundwater remediation near the primary source area at the facility. The annual progress report (WSP, November 2013) concluded that TCE and PCE concentrations appear relatively stable in MW-1 and MW-2 but have increased in MW-3.

Maximum PCE and TCE Concentrations <sup>(1)</sup> in Monitoring Wells November 2012 to October 2013						
Well   Well Position   PCE <sup>(2)</sup> (μg/L)   TCE <sup>(2)</sup> (μg/L)						
MW-1	Sidegradient	27.7	11.5			
MW-2	Extraction well at source	22.8	203			
MW-3	Near Source	61.3	1960			
MW-4	MW-4 Sidegradient		2.6			
MW-5	Č		111			
MW-6	MW-6 Downgradient		2			
MW-7	Sidegradient	$0.41J^{(3)}$	0.5J			
MW-8	Near Source	6.5	2.7			
MW-9	Sidegradient Offsite	ND	ND			
MW-10	Downgradient Offsite	0.69J	ND			
MW-11	MW-11 Sidegradient Offsite		ND			
RW-2 Extraction well at source		31.7	328			

- (1) Some wells monitor multiple fractures/depth intervals; maximum concentrations are listed regardless of interval.
- (2) The MCL for PCE and TCE is  $5 \mu g/L$ .
- (3) ND Non-detect; J Estimated value.

Environmental Indicator Inspection Report for Emerson Electric Company, Brooks Instrument Division, prepared by Baker, December 2013.

<sup>&</sup>lt;sup>1</sup> "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriate "levels" (appropriate for the protection of the groundwater resource and its beneficial uses).

3.	Has the <b>migration</b> of contaminated groundwater <b>stabilized</b> (such that contaminated groundwater is expected to remain within "existing area of contaminated groundwater"2 as defined by the monitoring locations designated at the time of this determination)?		
	X	If yes - continue, after presenting or referencing the physical evidence (e.g., groundwater sampling/measurement/migration barrier data) and rationale why contaminated groundwater is expected to remain within the (horizontal or vertical) dimensions of the "existing area of groundwater contamination" <sup>2</sup> ).	
		If no (contaminated groundwater is observed or expected to migrate beyond the designated locations defining the "existing area of groundwater contamination" <sup>2</sup> ) - skip to #8 and enter "NO" status code after providing an explanation.	
		If unknown - skip to #8 and enter "IN" status code.	

#### **Rationale and Reference(s):**

In general, contaminant concentrations have either remained stable or decreased over time. Remedial efforts including the startup of a pump-and-treat system in 1980, several soil removal efforts, and the operation of a soil vapor extraction system in one source area from 2007 to 2012 have removed contaminant mass from both soil and groundwater at the facility. An additional recovery well (RW-2) was added to the pump-and-treat system in 2009 to address the source area on the southwest side of the main building. The pump-and-treat system also serves to stabilize the migration of contaminated groundwater by containing the majority of it on-site, in addition to mitigating the effects of past and current production wells to the northeast and west on localized groundwater flow beneath the facility.

Environmental Indicator Inspection Report for Emerson Electric Company, Brooks Instrument Division, prepared by Baker, December 2013.

<sup>&</sup>lt;sup>2</sup> "existing area of contaminated groundwater" is an area (with horizontal and vertical dimensions) that has been verifiably demonstrated to contain all relevant groundwater contamination for this determination, and is defined by designated (monitoring) locations proximate to the outer perimeter of "contamination" that can and will be sampled/tested in the future to physically verify that all "contaminated" groundwater remains within this area, and that the further migration of "contaminated" groundwater is not occurring. Reasonable allowances in the proximity of the monitoring locations are permissible to incorporate formal remedy decisions (i.e., including public participation) allowing a limited area for natural attenuation.

4.	Does	Does "contaminated" groundwater <b>discharge</b> into <b>surface water</b> bodies?			
		If yes - continue after identifying potentially affected surface water bodies.			
	X	If no - skip to #7 (and enter a "YE" status code in #8, if #7 = yes) after providing an explanation and/or referencing documentation supporting that groundwater "contamination" does not enter surface water bodies.			
		If unknown - skip to #8 and enter "IN" status code.			

#### **Rationale and Reference(s):**

There are no significant surface water bodies near the facility and groundwater beneath the facility is sufficiently deep to preclude discharge to any surface water in the vicinity. A stormwater retention pond located north of the main building receives stormwater and treated groundwater and eventually discharges to Neshaminy Creek.

References: Annual Progress Report, Groundwater Recovery Program, Brooks Instrument, prepared by WSP, November 2013.

Environmental Indicator Inspection Report for Emerson Electric Company, Brooks Instrument Division, prepared by Baker, December 2013.

5.	Is the <b>discharge</b> of "contaminated" groundwater into surface water likely to be " <b>insignificant</b> " (i.e., the maximum concentration <sup>3</sup> of each contaminant discharging into surface water is less than 10 times their appropriate groundwater "level," and there are no other conditions (e.g., the nature, and number, of discharging contaminants, or environmental setting), which significantly increase the potential for unacceptable impacts to surface water, sediments, or eco-systems at these concentrations)?
	If yes - skip to #7 (and enter "YE" status code in #8 if #7 = yes), after documenting: 1) the maximum known or reasonably suspected concentration <sup>3</sup> of <u>key</u> contaminants discharged above their groundwater "level," the value of the appropriate "level(s)," and if there is evidence that the concentrations are increasing; and 2) provide a statement of professional judgement/explanation (or reference documentation) supporting that the discharge of groundwater contaminants into the surface water is not anticipated to have unacceptable impacts to the receiving surface water, sediments, or eco-system.
	If no - (the discharge of "contaminated" groundwater into surface water is potentially significant) - continue after documenting: 1) the maximum known or reasonably suspected concentration <sup>3</sup> of <u>each</u> contaminant discharged above its groundwater "level," the value of the appropriate "level(s)," and if there is evidence that the concentrations are increasing; and 2) for any contaminants discharging into surface water in concentrations <sup>3</sup> greater than 100 times their appropriate groundwater "levels," the estimated total amount (mass in kg/yr) of each of these contaminants that are being discharged (loaded) into the surface water body (at the time of the determination), and identify if there is evidence that the amount of discharging contaminants is increasing.
	If unknown - enter "IN" status code in #8.

**Rationale and Reference(s):** 

<sup>&</sup>lt;sup>3</sup> As measured in groundwater prior to entry to the groundwater-surface water/sediment interaction (e.g., hyporheic) zone.

6.	Can the <b>discharge</b> of "contaminated" groundwater into surface water be shown to be " <b>currently acceptable</b> " (i.e., not cause impacts to surface water, sediments or eco-systems that should not be allowed to continue until a final remedy decision can be made and implemented <sup>4</sup> )?
	If yes - continue after either: 1) identifying the Final Remedy decision incorporating these conditions, or other site-specific criteria (developed for the protection of the site's surface water, sediments, and eco-systems), and referencing supporting documentation demonstrating that these criteria are not exceeded by the discharging groundwater; OR  2) providing or referencing an interim-assessment,5 appropriate to the potential for impact, that shows the discharge of groundwater contaminants into the surface water is (in the opinion of a trained specialists, including ecologist) adequately protective of receiving surface water, sediments, and eco-systems, until such time when a full assessment and final remedy decision can be made. Factors which should be considered in the interim-assessment (where appropriate to help identify the impact associated with discharging groundwater) include: surface water body size, flow, use/classification/habitats and contaminant loading limits, other sources of surface water/sediment contamination, surface water and sediment sample results and comparisons to available and appropriate surface water and sediment "levels," as well as any other factors, such as effects on ecological receptors (e.g., via bio-assays/benthic surveys or site-specific ecological Risk Assessments), that the overseeing regulatory agency would deem appropriate for making the EI determination.
	If no - (the discharge of "contaminated" groundwater can not be shown to be " <b>currently acceptable</b> ") - skip to #8 and enter "NO" status code, after documenting the currently unacceptable impacts to the surface water body, sediments, and/or eco-systems.
	If unknown - skip to 8 and enter "IN" status code.
Ration	nale and Reference(s):

<sup>&</sup>lt;sup>4</sup> Note, because areas of inflowing groundwater can be critical habitats (e.g., nurseries or thermal refugia) for many species, appropriate specialist (e.g., ecologist) should be included in management decisions that could eliminate these areas by significantly altering or reversing groundwater flow pathways near surface water bodies.

<sup>&</sup>lt;sup>5</sup> The understanding of the impacts of contaminated groundwater discharges into surface water bodies is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration to be reasonably certain that discharges are not causing currently unacceptable impacts to the surface waters, sediments or eco-systems.

Page 7

7.	neces	Will groundwater <b>monitoring</b> / measurement data (and surface water/sediment/ecological data, as necessary) be collected in the future to verify that contaminated groundwater has remained within the horizontal (or vertical, as necessary) dimensions of the "existing area of contaminated groundwater?"		
	X	If yes - continue after providing or citing documentation for planned activities or future sampling/measurement events. Specifically identify the well/measurement locations which will be tested in the future to verify the expectation (identified in #3) that groundwater contamination will not be migrating horizontally (or vertically, as necessary) beyond the "existing area of groundwater contamination."		
		If no - enter "NO" status code in #8.		
		If unknown - enter "IN" status code in #8.		

#### **Rationale and Reference(s):**

Monthly monitoring of the treated groundwater discharge and quarterly monitoring of MW-1, MW-2, and MW-3 are required under the facility's NPDES permit, and remedial activities to address contamination near the southwest side of the main building and the increase in concentrations in MW-3 are under discussion.
