Overview of the Draft Biological Evaluations (BEs) for the ESA Pilot Chemicals (Chlorpyrifos, Malathion, and Diazinon)

> Melissa Panger Chuck Peck Elizabeth Donovan

> > May 5, 2016

### Overview

- Brief background
- Overview of the Draft BE process
  - Problem Formulation
  - Effects Characterization
  - Exposure Characterization
  - Effects Determinations
- Navigating the documents
- Instructions for public comment
- Next steps

- Endangered Species Act (ESA)
  - Section 7 requires federal agencies to consult with the Services\* on actions that may affect a federally listed species
- First national-level pesticide ESA consultations
- Following the recommendations of the 2013 National Academy of Sciences' (NAS) (National Resource Council) report on assessing risks to endangered and threatened species from pesticides

\*Services = National Marine Fisheries Service and the United States Fish and Wildlife Service

- First three pilot chemicals (all organophosphate insecticides):
  - Chlorpyrifos
  - Diazinon
  - Malathion
- Conducted as part of EPA's Registration Review Process
  - Registration Review the EPA periodically reviews all pesticides to ensure they meet current standards for human health and environmental safety

Chlorpyrifos

Diazinon

Malathion

### • Collaborative effort among the:

- United States Environmental Protection Agency (EPA)
- National Marine Fisheries Service (NMFS)
- United States Fish and Wildlife Service (FWS)
- United States Department of Agriculture (USDA)
- November 2013 release of interim scientific methods for implementing NAS recommendations
  - https://www.epa.gov/endangered-species/implementing-nas-reportrecommendations-ecological-risk-assessment-endangered-and

### • Current Interim scientific method developed in 2013 - 2015

- Four interagency meetings
- Four stakeholder workshops

- Updates on the interim process were provided at scientific meetings in 2014 and 2015
  - Society of Environmental Toxicology and Chemistry (SETAC)
  - American Chemical Society (ACS)
- A subset of the draft BE documents for chlorpyrifos, malathion, and diazinon were posted to an EPA website in Dec. 2015
  - https://www.epa.gov/endangered-species/implementing-nas-report-recommendations-ecological-risk-assessment-endangered-and
- The entire draft BEs (including all associated documents) were posted to the EPA's ESPP website in April 2016
  - https://www.epa.gov/endangered-species/implementing-nas-report-recommendations-ecological-risk-assessment-endangered-and
- Currently seeking public comments on the draft BEs
  - The public comment period on the draft BEs close on June 10, 2016

- The consultation process involves:
  - EPA's risk assessment (*i.e.*, the Biological Evaluation) that serves as the basis for the Services' Biological Opinion

The draft process follows the 2013 NAS recommendations for a 3-step approach:

- The <u>Biological Evaluation (BE)</u> determines whether registered pesticides adversely affect one or more individuals of a listed species and their designated critical habitats
  - **Step 1** ["No Effect/May Affect" Determination]
  - Step 2 ["Not Likely to Adversely Affect (NLAA)/Likely to Adversely Affect (LAA) Determination]
- The <u>Biological Opinion (BiOp)</u> determines whether registered pesticides result in 'jeopardy' for a listed species or 'adverse modification' of designated critical habitat
  - Step 3 ["Jeopardy/No Jeopardy" Determination and "Adverse Modification/No Adverse Modification" Determination]

- Outlines the strategic framework and analysis plan for evaluating risk posed by the stressors of the action to one or more individuals of a listed species and their critical habitats
  - Describes the Federal Action
  - Provides information on the pesticide active ingredient
  - Discusses conceptual models
  - Describes the analysis plan

Chapter 1: Draft Chlorpyrifos Problem Formulation for ESA Assessment (DOCX) (58 pp, 1.22 MB) Attachments

- ATTACHMENT 1-1: Ecological Incidents (DOCX) (2 pp, 17 K)
- ATTACHMENT 1-2: CDL Crosswalk (DOCX) (6 pp, 35 K)
- ATTACHMENT 1-3: Method for Establishing the Use Footprint (DOCX) (10 pp, 31 K)
- ATTACHMENT 1-4: Process for Determining Effects Thresholds (DOCX) (5 pp, 27 K)

- Description of the federal action being assessed:
  - The Federal Action under the ESA encompasses the EPA's registration of the uses, as described by product labels, of all pesticide products containing the pesticide being assessed
  - The Federal Action includes products registered under Section 3 (national labels), Section 24c (Special local need labels) and Section 18 (emergency exemptions)

### • Fate overview

- Chlorpyrifos, malathion, and diazinon:
  - Vary in their persistence in the environment
  - Are moderately mobile
  - Show some evidence for volatilization
  - Have variable aquatic solubility limits (chlorpyrifos is the least soluble of the three chemicals)
  - Are not expected to bioaccumulate in the environment (see Chapter 3)
- Potential sources of offsite transport are spray drift, volatilization, and runoff

- Risk Hypotheses:
  - Use of the pesticide, according to registered labels, results in exposure that reduces the fitness of an individual of a listed species based on:
    - direct effects
    - indirect effects
  - Use of the pesticide, according to registered labels, results in effects to designated critical habitat by adversely impacting primary constituent elements (PCEs) or other essential physical and biological features (PBFs)
- Considers all of the known stressors of the action [*e.g.*, parent active ingredient and its degradate of concern (oxon), formulations, and mixtures] and abiotic or biotic factors likely present in the environment that may alter the toxicity of the pesticide

- Step 1
  - "May Affect" determination will be made for any listed species and/or designated critical habitat that overlaps with the action area
  - Action area "...all areas to be affected directly or indirectly by the Federal action and not merely the immediate area involved in the action" (50 CFR §402.2)

#### Step 1: Action Area and Species' Ranges

#### Determination based on overlap of action area and species' ranges

- Action area = Pesticide use sites + off-site transport
- Step 1 Determinations: Species 1: No effect Species 2: May affect Species 3: May affect

- Step 1
  - The footprint layer represents the application site for agricultural and nonagricultural label uses.

- Step 1
  - Agricultural Use Sites:
    - The Cropland Data Layer (CDL), produced by the USDA, is used to spatially represent potential agricultural use sites.
      - The CDL is a land cover dataset that has over 100 cultivated classes that the Agency groups into 11 general classes.
      - 5 years of the most recent CDLs, from 2010-2014, are aggregated to account for crop rotations.
    - The agricultural classes are further refined by comparing county level National Agricultural Statistics Service (NASS) Census of Agriculture (CoA) acreage reports to county level CDL acreages.
    - If a county's CDL acreage for a given class is lower than the NASS acreage, the CDL class's extent is expanded within cultivated areas until the CDL acreage matches the NASS Census acreage.

### • Step 1

- Non-Agricultural Use Sites:
  - Non-agricultural label uses include a wide range of land cover and land use categories.
  - Each label use is considered and represented by the best available land cover data.
  - Generally, the National Land Cover Dataset (NLCD) is used to represent non-agricultural label uses. When the NLCD is inadequate, other data sources are used as appropriate.

- The action area is based on the lowest toxicity value for the most sensitive species in the environment that results in the farthest distance from the use site(s):
  - Animals:
    - <u>Mortality</u> concentration that results in a 1-in-a-million chance of mortality [based on HC<sub>05</sub> of SSD or most sensitive LC<sub>50</sub>/LD<sub>50</sub> (if an SSD cannot be derived)]
    - <u>Sublethal Effects</u> concentration equal to the lowest NOAEC/NOAEL/EC<sub>x</sub> value for an effect relatable to survival, growth, or reproduction and environmentally relevant exposure routes
  - Plants:
    - Concentration equal to the lowest NOAEC or EC<sub>05</sub> value

- Evaluation conducted primarily with GIS tools looking at Crop Data Layers as surrogate for pesticide use sites and species range and critical habitat data provided by the Services
  - Answering the question "Is there potential for direct and/or indirect effects from the action?"
- No Effect /May Affect determination
  - No Effect (*i.e.*, no overlap) no need to seek consultation with Services
  - May Affect (*i.e.*, overlap) move to step 2

#### • Process is intended:

- To be conservative
  - Use "high end" estimates of exposure
  - Use toxicity thresholds based on sensitive endpoints
- Support weight of evidence approach
  - Use range of exposure estimates
  - Use other toxicity data considered
- To assess risks of a pesticide to approximately 1800 species
  - Efficiently
  - Transparently
  - Consistently

- Step 2 Describe how to answer the questions:
  - Is there a potential for an individual's fitness to be reduced?
  - Is there a potential for important physical and biological features of a species habitat to be adversely affected?
- Describes the process for making Likely to Adversely Affect(LAA)/Not Likely to Adversely Affect (NLAA) Determinations
  - LAA species/critical habitat moves to Step 3 (jeopardy/adverse modification determination)
  - NLAA concurrence from the Services

- The Analysis Plan also includes a description of:
  - Weight-of-evidence approach
  - Lines of evidence
  - Estimating exposures (in aquatic and terrestrial habitats)
  - Effects thresholds (direct and indirect effects)
  - Effects arrays
  - Incident data
  - Mixture analysis
  - Consideration of biotic and/or abiotic effects on toxicity

- Weight-of-Evidence approach (WoE) Uses various lines of evidence to evaluate the totality of the direct and indirect impacts of the action on the species and/or critical habitat. Lines of evidence include:
  - Mortality
  - Growth
  - Reproduction
  - Behavior
  - Sensory effects
  - Mixtures
  - Abiotic/Biotic factors
- Evaluate both the exposure and effects data to determine the weight of the 'risk' and 'confidence' associated with the data available for each line of evidence

### • Exposure

- Relevance of environmental models for generating EECs for receiving habitats (terrestrial and aquatic)
- Robustness of EECs derived from environmental models
- Effects
  - Biological relevance of effects data
    - Is there a relationship between the effects data and line of evidence?
  - Surrogate relevance of effects data
    - Is the effects data measured with the listed species or an appropriate surrogate?
  - Robustness of information
    - Do we have multiple, independent studies that show the same effect?

 WoE template (animals) – filled out for each listed species included in Step 2:

	Weight of evidence (confidence in exposure and effects data)				Risk	Overall confidence	
Lines of Evidence	Fact	ors to consi	(Overlap of exposure	high,			
	EXPOSURE				EFFECTS		
	Relevance	Robustness	Biological Relevance	Species Surrogacy	Robustness	and effect/	low
Mortality	1						
Growth							
Reproduction							
Behavioral							
Sensory effects							
Indirect effects							
Mixtures							
Abiotic/Biotic factors (bacterial/viral. pH, temperature)							

• Effects determinations based on pairings of risk and confidence for the lines of evidence:

Risk Estimate (for any line of evidence)	Confidence	Effect Determination
High	High	LAA
High	Med	LAA
High	Low	LAA
Medium	High	LAA
Medium	Medium	LAA
Medium	Low	NLAA or LAA*
Low	High	NLAA
Low	Medium	NLAA or LAA*
Low	Low	NLAA or LAA*

\* The selection of the appropriate effects determination associated with this 'risk' and 'confidence' pairing may require additional discussion with FWS and NMFS.

- Exposure Conceptual Approach:
  - Scale of assessment is at field or water body
    - Terrestrial species:
      - Assume that individual can be exposed on the field
      - Assume that individual can be exposed in area adjacent to field (via spray drift and/or runoff)
    - Aquatic species:
      - Assume that individual can be exposed in water body adjacent to field
      - Off site transport via drift and downstream movement considered for species not adjacent to field

### • Estimating aquatic exposures

- Use current aquatic models available in EFED
- Regional (HUC 2) scale modeling of pesticide applications to variety of waterbodies
  - 3 flowing, 3 static, and 3 estuarine/marine
- Regional use scenarios developed by modifying existing use scenarios to reflect weather in region

### • Estimating aquatic exposures

- Step 1 (overlap of action area w/ species range)
  - Use most protective scenario, smallest waterbodies, and lowest toxicity threshold
  - Incorporate impacts of spray drift and downstream dilution
- Step 2 (LAA/NLAA evaluation)
  - Conduct regional analyses using all relevant use scenarios and waterbodies (bins as assigned to specific species)

#### • Estimating aquatic exposures

• Aquatic Bins:

Generic Habitat	Depth (meters)	Width (meters)	Length (meters)	Flow (m³/s)
1 – Aquatic-associated terrestrial habitats	NA	NA	NA	NA
2- low-flow	0.1	2	Length of field <sup>1</sup>	0.001
3- Moderate-flow	1	8	Length of field <sup>1</sup>	1
4- High-flow	2	40	Length of field <sup>1</sup>	100
5 – Low-volume	0.1	1	1	0
6- Moderate-volume	1	10	10	0
7- High-volume	2	100	100	0
8- Intertidal nearshore	0.5	50	Length of field	NA
9- Subtidal nearshore	5	200	Length of field	NA
10- Offshore marine	200	300	Length of field	NA

<sup>1</sup> length of field – The habitat being evaluated is the reach or segment that abuts or is immediately adjacent to the treated field. The habitat is assumed to run the entire length of the treated area.

#### • Estimating aquatic exposures

• Conceptual model

- Estimating aquatic exposures
  - Updates to tools
    - Pesticide in Water Calculator (PWC)
    - New use scenarios
    - Ability to batch run hundreds to thousands of files
  - PWC Postprocessor
    - Spreadsheet tool designed to post process PWC runs and generate graphs and tables to assist in making an effects determination
    - Generates:
      - Probability distribution
      - Spread of EECs by Julian date
      - Number of exceedances per month
      - Exceedance determination for each species in HUC 2 and aquatic bin

- Estimating terrestrial exposures
  - Terrestrial Effects Determination (TED) Tool
    - Assesses exposures to mammals, birds, reptiles, amphibians, invertebrates (terrestrial) and plants
    - Relies upon species-specific information (diet, body weight)
    - Integrates existing Tier I models
      - T-REX, T-Herps, Earthworm fugacity model, BeeREX, Terrplant, AgDRIFT, portions of TIM

- Estimating terrestrial exposures
  - TED Tool:
    - Assesses dietary and dose based exposures
      - Dose based exposures include diet, dermal, inhalation and drinking water routes
        - Adapted from Terrestrial Investigation Model (TIM)
    - Food items included for dietary exposures
      - Plants (grass, broadleaves, flowers, nectar, seeds, fruit)
      - Invertebrates (terrestrial above and below ground, aquatic)
      - Vertebrates (mammals, birds, reptiles, amphibians, carrion, fish)
    - Dermal = direct spray, contact with contaminated foliage
    - Drinking water = dew, puddles
    - Inhalation = direct spray, vapor phase
  - The TED tool considers different exposure routes, but does NOT combine the exposures across these routes

- Estimating terrestrial exposures
  - Refined assessment for a subset of listed bird species (13)
    - TIM Terrestrial Investigation Model
    - MCnest Markov Chain Nest Productivity Model
  - Determine probability and magnitude of mortality to exposed individuals (TIM)
  - Determine declines in fecundity (MCnest)
  - For diazinon (for one species):
    - Explore refined methods for estimating proportion of population exposed
    - Identify preferred habitats of species within county-level ranges provided by the Services

Least Bells vireo

• Effects thresholds (animals)

Mortality:

- Direct effects 1 in a million chance
- Indirect effects 10% chance of mortality
  <u>Sublethal</u>:
- Direct effects Most sensitive NOAEC
- Indirect effects most sensitive LOAEC

Taxon (Direct Effects) (Indirect Effects) or Taxa on which a listed species depends	Mortality	Sublethal Effects		
Birds <sup>1</sup> Mammals <sup>1</sup>	<u>Direct Effects</u> : Concentration (or dose) that would result in a chance of 1 in a million of causing mortality to an individual. This is calculated by using HC05 of SSD2 of LC50, LD50, or EC50 values for taxa and representative slope. If SSD cannot be derived, most sensitive LC50, LD50, or EC50 for taxa will be used and most representative slope <u>Indirect Effects</u> : Concentration (or dose) that would result in a decrease of 10% of individuals (i.e. the EC <sub>10</sub> ). This is calculated by using HC <sub>05</sub> of SSD of LC <sub>50</sub> /LD <sub>50</sub> or EC <sub>50</sub> values and representative slope. If SSD cannot be derived, most sensitive LC <sub>50</sub> /LD <sub>50</sub> or EC <sub>50</sub> will be used.			
Reptiles Terrestrial-phase amphibians				
Aquatic-phase amphibians		<u>Direct effects</u> : Lowest available NOAEC/NOAEL or other scientifically		
Fish Aquatic invertebrates		can be linked to survival or reproduction of a listed individual will be used.		
Terrestrial invertebrates		growth or reproduction will be used (se text for details).		

<sup>1</sup>Lowest LD50 or NOAEL/LOAEL for birds and mammals determined by normalizing results to 100 g body weight for birds and 15 g body weight for mammals prior to establishing threshold values. <sup>2</sup> SSD = Species Sensitivity Distribution
### • Effects thresholds (plants)

### Mortality:

### - None

### Sublethal:

- Direct effects most sensitive NOAEC
- Indirect effects most sensitive LOAEC/EC<sub>50</sub> (aquatic plants)/EC<sub>25</sub> (terrestrial plants)

Taxon (Direct Effects) (Indirect Effects) or Taxa on which a listed species depends	Sublethal Effects (Direct)	Sublethal Effects (Indirect)
Aquatic plants Terrestrial plants	Aquatic plants: <u>Non-vascular</u> - Concentration equal to the lowest value among the available NOAEC and EC05 values for non-vascular aquatic plants <u>Vascular</u> - Concentration equal to the lowest value among the available NOAEC	
Wetland plants	and EC05 values for vascular aquatic plants <i>Terrestrial and wetland plants</i> : <u>Monocots</u> - Concentration equal to the lowest value among the monocot NOAEC and EC05 values from the available seedling emergence and vegetative vigor studies <u>Dicots</u> - Concentration equal to the lowest of the dicot NOAEC and EC05 values from the available seedling emergence and vegetative vigor studies <u>Non-angiosperm</u> - Concentration equal to the lowest of the NOAEC and EC05 values from the available seedling emergence and vegetative vigor studies	Aquatic plants: Concentration equal to the lowest available LOAEC and $EC_{50}$ value for aquatic plants Terrestrial and wetland plants: Concentration equal to the lowest LOAEC and $EC_{25}$ value from the available seedling emergence and vegetative vigor studies

- Effects thresholds: New tools developed to facilitate analysis of large amounts of toxicity data
  - Array Builder
    - Spreadsheet designed to process effects data from ECOTOX as well as registrant submitted studies
    - Allows graphical presentation of data together and to evaluate all data holistically
    - Integrates Adverse Outcome Pathway
    - Filters data by species (family, genus), endpoint type (dietary, dose), and effect

#### Figure 5-10. Dietary-based Reproduction Endpoints (mg a.i./kg-diet) for Birds Exposed to Chlorpyrifos.

Data from registrant submitted (red) and open literature (blue). Bars represent NOAEC/LOAEC range with the LOAEC value represented by the colored data point (studies where only a LOAEC was identified are represented with single data point). (LCx=x% mortality, NR-LETH=100% mortality). Data label key: Endpoint (measured effect, species, duration in days).

- Effects thresholds: New tools developed to facilitate analysis of large amounts of toxicity data
  - SSD toolbox
    - Allows assessor to select best distribution from 5 different distributions
    - Improves consistency
    - Methods presented to SAP in 2012

Table 2-4. Summary Statistics for SSDs Fit to Malathion Test Results (toxicity values reported in unit

Figure 2-6. SSD for Malathion LC50s for Freshwater Fish. Black points indicate single toxicity values. Red points indicate multiple toxicity values. Blue line indicates full range of toxicity values for a given taxon.

- Mixtures
  - Mixtures considered qualitatively
    - Additive toxicity of the pesticide being assessed with other chemicals is the default assumption based on inter-agency discussions and the NAS NRC report recommendations.
    - The NRC report states that "mixture components will contribute to the response only when present in the environment at concentrations that elicit relevant response... [and] such components do not need to be considered when present at concentrations below their toxic thresholds." (NRC, 2013)

# Overview of the Draft BE Process – Effects Characterization

- Summarizes effects of active ingredient on animals and plants
  - Also incorporates available formulation data
  - Uses data from both submitted studies and open literature (ECOTOX)
- Organized by taxon
  - Aquatic: fish, invertebrates, plants
  - Terrestrial: birds, amphibians and reptiles, mammals, invertebrates, plants
- Each taxon section:
  - Provides a table with the effects thresholds
  - Summary effects arrays
  - Specific effects information organized by lines of evidence
    - Mortality, growth, reproduction, behavior, and sensory

### Overview of the Draft BE Process – Effects Characterization

- Chlorpyrifos, malathion, and diazinon are insecticides that act by inhibiting cholinesterase activity, thereby preventing the natural breakdown of various cholines and ultimately causing the neuromuscular system to seize.
- The effects of these chemicals have been studied extensively in many taxa, particularly in fish and aquatic and terrestrial invertebrates.
- Studies include acute and chronic laboratory studies with either technical or formulated products.

### Overview of the Draft BE Process – Effects Characterization

- Chlorpyrifos:
  - The BE considered more than 1,400 ecotoxicity studies (including ~180 fish studies, 26 amphibian studies, ~ 330 aquatic invertebrate studies, 32 aquatic plant studies, 58 bird studies, 1 reptile study, ~160 mammalian studies, ~500 terrestrial invertebrate studies, and ~125 terrestrial plant studies).
- Malathion:
  - The BE considered more than **900** ecotoxicity studies for malathion (including (approximates) 225 fish and aquatic-phase amphibian studies, 260 aquatic invertebrate studies, 25 aquatic plant studies, 47 bird studies, 7 reptile and terrestrial-phase amphibian studies, 150 mammalian studies, 140 terrestrial invertebrate studies, and 49 terrestrial plant studies).

### • <u>Diazinon</u>:

The BE considered more than 500 ecotoxicity studies for diazinon (including approximately 130 fish studies, 10 amphibian studies, 130 aquatic invertebrate studies, 10 aquatic plant studies, 80 bird studies, 1 reptile study, 70 mammalian studies, 170 terrestrial invertebrate studies, and 60 terrestrial plant studies).

## Overview of the Draft BE Process – Exposure Characterization

- Provides information on:
  - The fate and transport properties for each chemical
  - Detailed information on specifically how the aquatic and terrestrial exposure estimates were determined for each chemical
  - Aquatic EECs (based on thousands of modeling runs):
    - Chlorpyrifos: >12,000 PWC runs
    - Malathion: ~6,000 PWC runs
    - Diazinon: >45,000 PWC runs

### • Step 1

- "No Effect" determination -
  - When no co-occurrence is identified between the listed species range (including designated critical habitat) and the action area (area of effect including the site of application and off-site transport).
  - "No Effect" determinations were also made for species with no designated critical habitat that met at least one of the following criteria: a) the species is presumed by the U.S. Fish and Wildlife Service (USFWS) to be extinct; b) the species no longer occurs in the US; or c) the species exists only in captivity.
- "May Affect" determination = When co-occurrence is identified between the listed species range (and/or designated critical habitat) and the action area (area of effect including the site of application and off-site transport).
  - Species and/or its designated critical habitat with 'May Affect' determinations move to Step 2 for further analysis.

- Step 1 (Action Area)
  - Chlorpyrifos and Malathion = the entire US and its territories
    - Due to uses that could not be geographically limited based on label information (e.g., mosquito adulticides)
  - Diazinon =
    - Includes all label uses (vegetable and ground fruit, orchard and vineyards, nurseries, and cattle eartag) and offsite transport

• Step 1 – Chlorpyrifos and Malathion

• Step 1 – Diazinon

- Step 2
  - Most of the effects determinations in Step 2 were made using a Weight of Evidence Matrix Generator
    - Automates completion of matrix to include species characteristics, exposure values and toxicity endpoints
      - Relies upon listed species life history database
    - Incorporates direct effects, indirect effects (based on diet and habitat) and obligate relationships
    - Includes overlap data for range and potential use sites (based on the labels)
    - Tool for overlap analysis

	Species scientific name	Palmeria dolei	Species order:	Passeriformes			
	Species common name	Crested honeycreeper		MIGRATORY SPECIES?	No	ALTERNATE RATE OUTPUT DISPLAYED FOR THIS SPECIES?	Yes
						-	
	Species number	74		CRITICAL HABITAT?	Yes		
	TAXA	Birds		OBLIGATE RELATIONSHIP?	No		
Risk hypothesis	Use of malathion according to registered labels results in	exposure that reduces the fitn	ess of an individual based	on direct effects [Crested honeyc	reeper ]		
		Summary of consideration	ns impacting risk and co	nfidence			
Line of evidence	Exposure	I		Effects		Risk (extent of overlap of exposure and effects data)	Confidence (associated with risk conclusion)
	Relevance	Robustness	Relevance (biological)	Surrogacy	Robustness		
Mortality	Occurs in Maui, Hawaii; Inhabits: Forest, monane wet and mesic forest; Elevation restriction: 1500 to 2100 meters	T-REX EECs based on empirical residues.	Mortality is relevant to species fitness.	Seven avian species represented in LD50 results which included two Passeriforme species.	18 LC50 and LD50 avian values are available.	нідн	HIGH
	HABITAT: Top species range overlap(s): 100.00, 16.96, 1.76, 1.73 and 1.05%. Corresponding CDL layer(s): Mosquito Control, Pasture, Vegetables and Ground Fruit, Developed and Open Space Developed.This species has overlap with nonspecified agricultural uses in Hawaii corresponding with 1.50% overlap, respectively. This species also occurs on federal land. The range overlap is 6.49% with the corresponding federal lands of Federally Managed Lands.	Chemical specific foliar dissipation half-life based on 90th percentile of observed foliar dissipation half-life values (n = 37; 0.3 and 10.9 days).	Endpoints beyond 1/million threshold were considered.	SSD derived for dose-based endpoints.	Data available for dose and dietary rate units.	Upper bound EECs based on dietary exposure through food exceeds the 1-in-a-million threshold, does not exceed the LD50 and does not exceed the HC50 for a single application at the minimum application rate of 0.5 lb a.i./A as compared to dose-based endpoints. At the upper bound single application rate of 2 lb a.i./A the maximum EEC based on the highest food item concentration exceeds the 1-in-a-million threshold, exceeds the LD50 and does not exceed the HC50. For the minimum application rate and mean EECs based on the minimum dietary food item concentration, the EEC exceeds the 1-in-a-million threshold, does not exceed the LD50 and does not exceed the HC50.	

- Step 2
  - Potential risks to some listed species/critical habitats were assessed qualitatively because EPA does not currently have methods available to adequately quantify potential exposures for these species.
    - In many cases, these species live exclusively (*i.e.*, whales, deep fish) or primarily (*i.e.*, sea turtles, marine mammals) in marine environments, or are cave dwellers (invertebrate species).
  - Other qualitative analyses focus on certain uses for which reliable exposure methods are not available as current terrestrial methods are focused on non-ULV flowable applications.
    - Cattle ear tag use (for chlorpyrifos and diazinon)
    - Granular and seed treatment uses (for chlorpyrifos)
    - Mosquito adulticides (chlorpyrifos and malathion)

Results for listed species

Results for critical habitats

- LAA for most listed species/designated critical habitats:
  - Due to overlap of range/critical habitat and potential uses sites
  - High toxicity (low thresholds), maximum use rates, other assumptions of exposure
  - LAA determination is based on the potential to impact a single individual of a listed species

NAS released its report in April 2013 with its recommendations. Read the NAS report. Exit

#### Status

Since receiving the NAS report, the agencies have been working together to develop shared scientific approaches that reflect the advice provided by the NAS. Working together, scientists from the requesting agencies have met, analyzed the recommendations and have developed interim approaches they will jointly implement as part of a phased iterative process. They are also identifying future tools, models and approaches that will need to be developed some time over a period of years.

Interim Approaches for Pesticide Endangered Species Act Assessments based on National Academy of Sciences Report Recommendations

EPA, in conjunction with FWS, NMFS, and USDA, has developed draft Biological Evaluations (BEc) in response to the NAS report. In December 2015, OPP released several documents associated with the Biological Evaluations (BEs) for the three pilot chemicals: chlorpyrifos, diazinon and malathion. In April 2016, EPA released the effects determination for each of the three pilot chemicals and open the docket for public comment. The information provided for each chemical will be on a separate page:

### Biological Evaluation Chapters for Malathion ESA Assessment

EPA, in conjunction with FWS, NMFS, and USDA, has developed draft Biological Evaluations (BEs) in response to the National Academy of Science report on assessing risks to threatened and endangered species from pesticides. In December 2015, OPP released several documents associated with the BEs for the three pilot chemicals: chlorpyrifos, diazinon and malathion.

In April 2016, EPA released the effects determination for each of the three pilot chemicals and opened the docket for public comment. The draft BE chapters for malathion are provided below.

Interim Approaches for Pesticide Endangered Species Act Assessments based on National Academy of Sciences Report Recommendations

EPA, in conjunction with FWS, NMFS, and USDA, has developed draft Biological Evaluations (BEs) in response to the NAS report. In December 2015, OPP released several documents associated with the Biological Evaluations (BEs) for the three pilot chemicals: chlorpyrifos, diazinon and malathion. In April 2016, EPA released the effects determination for each of the three pilot chemicals and open the docket for public comment. The information provided for each chemical will be on a separate page:

- <u>Chlorpyrifos</u>
- Diazinon
- Malathion
- Provisional models

### Provisional Models and Tools

68

Provisional models and tools can be found at: https://www.epa.gov/endangered-species/provisional-modelsendangered-species-pesticide-assessments

#### Introduction

The tools and models on this web page were developed for use in the Steps 1 and 2 analyses of national level assessments of the risks of chlorpyrifos, diazinon and malathion to endangered and threatened species and designated critical habitat. These models are provided to allow the public access to applications of the methods described in the draft Biological Evaluations (BEs) developed for these three chemicals. A number of these tools and models have not yet completed EPA's Quality Assurance (QA)/Quality Control (QC) process; however, they are provided here in order to provide transparency and allow for submission of public comment on the tools and models that are currently being considered for use in the draft BEs for chlorpyrifos, diazinon and malathion. Unless specified below (i.e., for the Pesticides Water Calculator), these models/tools and their outputs should be considered provisional and subject to revision following the completed QA/QC process including consideration of public comment.

### Aquatic tools and models:

New! Pesticide Water Calculator (PWC) ESA Automation Tool, v. 1.01 beta (XLSX) Revised March 2016 (1 pg, 41 K) Free Viewers

The PWC ESA Automation Tool is a spreadsheet that has been built to assist in developing the inputs necessary to run the ESA Batch feature available in the new version of the PWC. Each row below row 2 represents a PWC run. The user enters the appropriate information in the columns that have headers in black (columns A-T and AB-PN). The red columns will fill in automatically once the user copies the functions contained in row 3 to the rows being created. Row 1 provides guidance on the information required for some of the column input values. For instance, Column D is the Koc flag, which should be entered as either True or False. Additional instructions and information regarding data processing can be found in the "ReadMe" worksheet within the workbook. The tool has been updated to include field and waterbody inputs for hydrologic unit code (HUC) Region 19 (Alaska).

#### New! PWC ESA scenarios (zip file) Revised March 2016 (1 pg, 297 K) Free Viewers

For aquatic exposure assessments, input scenarios are used to represent a finite set of combinations of soil, weather, hydrology, and management/crop use conditions that are expected to maximize the potential for pesticides to move into surface water.

### Aquatic tools and models:

#### New! PWC Postprocessor, v. 1.0 beta (XLSX) (1 pp, 2.95 MB) (1 pg, 39 K) Free Viewers

The PWC Postprocessor is a spreadsheet that has been built to assist in analyzing the results from the multitude of PWC runs conducted for the draft BEs. The tool allows the user to compare EECs to aquatic thresholds, summarize EECs by HUC2 and bin combination, and make effects determinations for all listed species associated with aquatic habitats. The tool also allows the user to evaluate individual PWC runs conducted in support of the draft BEs. Before running the tool, the user should store all of the PWC runs and the summary file in a single directory. Additionally, the user should check the ErrorSummary file and ensure that no errors occurred during the PWC batch run. Additional instructions and information regarding data processing can be found in the "ReadMe" worksheet within the workbook.

#### New! PWC Non-ag Postprocessor, v. 1.0 beta (XLSX) (1 pp, 10.8 MB) Free Viewers

The PWC Non-ag Postprocessor is a spreadsheet that postprocesses the residential, impervious, and rights-of-way time series generated in the PWC and allows for the generation of the 1-in-10 year and 1-in-15 year EECs. For some of the pilot chemicals, non-agricultural uses (e.g., applying to gardens, lawns, around commercial buildings, etc.) have been modeled using multiple PWC scenarios which represent the variety of surface types that could occur in a nonagricultural setting (e.g., turf, impervious, right-of-way). The time series for the individual runs are normally combined afterwards to generate a time series and 1-in-10 ver 1-in-15 year statistics to represent the non-agricultural use. This spreadsheet automates this process. Additional instructions and information regarding data processing can be found in the "ReadMe" worksheet within the workbook. Note: This tool should be run prior to using the PWC Postprocessor so that the results can be incorporated into the analysis.

### Terrestrial tools and models:

#### **Terrestrial Tools and Models:**

New! Terrestrial Effects Determination (TED) tool, v. 1.0 beta (XLSX) Revised March 2016 (1 pg, 1.21 MB) Free Viewers

In order to improve efficiency and expand EFED's modeling capabilities to other, non-dietary routes of exposure for terrestrial organisms, the TED tool was developed. This tool integrates T-REX, T-HERPS, the earthworm fugacity model, TerrPlant and AgDRIFT. In addition to dietary based exposures, the tool also estimates pesticide doses to animals exposed via drinking water, dermal and inhalation routes. The TED tool estimates concentration-based and dose-based pesticide exposures relevant to assessing risks of direct effects to listed species and indirect effects through declines in prey or impacts to habitat. Exposures are compared to relevant thresholds and endpoints and are used to estimate the distance from the edge of the field to which risk extends and the duration of time that residues are at levels representing a concern for effects to individual listed species.

### Terrestrial tools and models:

New! Integrated Terrestrial Investigation Model (TIM, v. 3.0 beta) and Markov Chain Nest Productivity Model (MCnest, v. 2.0 beta) (zip file) Revised March 2016 (1 pg, 704 K) Free Viewers

TIM has been integrated into the MCnest model to provide risk estimates associated with declines in survival and fecundity of birds exposed to pesticides. The models represent exposures on treated sites (e.g., agricultural fields and orchards) and adjacent areas receiving spray drift. A full description of TIM is available online. A full description of the basic <u>MCnest model</u> is also available online. The integrated version of TIM and MCnest replaces the T-REX portions of exposure used in the basic MCnest model.

The integrated TIM/MCnest model was designed in Matlab 2013b and requires the Matlab Compiler Runtime (MCR) to be installed on your computer. MCnest will not run without the MCR. Due to its size, we are not hosting the MCR on our website. It can be downloaded free of charge from the Mathworks Exit website. The required version is the Windows 64-bit MCR for Matlab release 2013b.

A new species library is available for use with the integrated <u>TIM/MCnest model (XLSX)</u> (1 pp, 14 K). This library includes life history parameters for 13 species of listed birds that are included in the refined avian risk assessment (Appendix 4-7). The metadata for these parameters are included in supplemental information 2 of Appendix 4-7.

### Effects tools:

#### Data Array Builder (DAB), v. 1.0 beta (zip file) (1 pg, 258 K) Free Viewers

The DAB generates ecotoxicity data arrays, or graphic representations of effects data, based on formatted ECOTOX data reports and user-entered registrant-submitted studies. Once the data have been inserted into the workbook and formatted according to the tool's instructions, the DAB allows sorting of the data by user-defined taxonomic group, effect type, and endpoint and generates dot plots presenting the data. The user can also create summary plots by effect type that show the range of values and median concentration for each type of effect.

#### Species Sensitivity Distribution (SSD) toolbox, v. 1.0 beta (zip file) (1 pg, 258 K) Free Viewers

The SSD toolbox allows the user to fit distributions to acute toxicity data available for tested species that fall within the same group (*e.g.*, fish, birds, invertebrates). It combines a variety of algorithms to support fitting and visualization of simple SSDs.

### Weight of Evidence (WoE) tools:

### Posting comments

The public comment period for the draft BEs will be open in April 2016. Because the file sizes of the draft BEs for chlorpyrifos, diazinon, and malathion exceed the docket system's file size limitation, the draft BEs will not be posted to the chlorpyrifos, diazinon, and malathion chemical dockets in <u>www.regulations.gov</u>. Instead, draft BEs for each of the three chemicals are posted on EPA's endangered species webpage. Commenters must post comments to each chemical's registration review docket at www.regulations.gov as detailed in Table 1.

Chemical	Link to the Draft BEs	Where to Post Comments
Chlorpyrifos	https://www.epa.gov/endangered- species/biological-evaluation-chapters- chlorpyrifos	EPA-HQ-OPP-2008-0850
Diazinon	https://www.epa.gov/endangered- species/biological-evaluation-chapters- diazinon	EPA-HQ-OPP-2008-0351
Malathion	https://www.epa.gov/endangered- species/biological-evaluation-chapters- malathion	EPA-HQ-OPP-2009-0317

Table 1. Links to the Draft BEs and Where to Post Comments

- Looking for comments on improving the BE approach/methodology, particularly as it relates to:
  - Identification of "best available" spatial data to represent potential pesticide use sites and species locations (Attachments 1-2 and 1-3)
  - Methods used to identify potential overlaps (and extent) of species locations and potential use sites and their applications in effects determinations made in Steps 1 and 2 (Attachment 1-6)
  - Estimation of exposure in various aquatic environments (bins) that have been regionally delineated and the parameterization of the bins and their relevance across the landscape (Attachment 3-1)
  - Evaluation of exposures in flowing water bodies and in non-freshwater habitats (e.g., tidal pools. estuaries) (Attachment 3-1)
  - Evaluation of exposure to terrestrial organisms, including dietary and non-dietary routes of exposure (Attachment 1-7)
  - Evaluation of mosquito adulticide applications including potential exposure and impact on the aquatic and terrestrial environments (Appendix 3-3 for chlorpyrifos and malathion)

- Cont. Looking for comments on improving the BE approach/ methodology, particularly as it relates to:
  - Use of species sensitivity distributions to evaluate effects (Attachment 1-5)
  - Characterization of toxicity data from registrant submitted toxicity data and scientific literature and utility of sublethal effects data (Attachments 1-4, and 1-22)
  - Use of mortality effects thresholds based on a chance of effects (i.e., I -in-a-million chance for direct effects and 10% chance of effect for indirect effects) (Attachment 1-4)
  - Methodology for assessing risks to plants (Attachment 1-2 1)
  - Weight-of-evidence approach used, including the high, medium and low weighting assignments to the various lines of evidence to evaluate risk and make effects detem1inations (Attachment 1-9)
  - "Qualitative" assessments for marine species and cave-dwelling terrestrial species (Chapter 4).

• Please direct questions related to this effort or concerning the registration reviews for chlorpyrifos, diazinon, and malathion, to the chemical review manager identified in the table below:

Registration Review Case Name and Number	Pesticide Docket ID Number	Chemical Review Manager, Telephone Number, Email Address
Chlorpyrifos, case 100	EPA-HQ-OPP-2008-0850	Dana Friedman, 703-347-8827, friedman.dana@epa.gov
Diazinon, case 238	EPA-HQ-OPP-2008-0351	Khue Nguyen, 703-347-0248, nguyen.khue@epa.gov
Malathion, case 248	EPA-HQ-OPP-2009-0317	Steven Snyderman, 703-347-0249, snyderman.steven@epa.gov

#### Pesticide Contacts for Chlorpyrifos, Diazinon, and Malathion

## Overview of the Draft BE Process – Next Steps

- ESA Stakeholder Workshop
  - 2-day meeting in summer of 2016
  - Format will include plenary and break-out sessions
  - Prioritizing topics for break-outs
    - Refinements of the interim methods; earlier screening
    - Aquatic bin parameterization and estimation of flowing water EECs
    - Weight-of-Evidence Approach

## Overview of the Draft BE Process – Next Steps

- Proposed schedule for chlorpyrifos, diazinon and malathion:
  - December 2016: Final BE
  - April 2017: Draft BiOp
  - December 2017: Final BiOp
- Proposed schedule for carbaryl and methomyl
  - December 2016: draft BEs
  - December 2018: Final BiOp
