2010 Laboratory Data *(on compact disc)*

Appendix 1-E1

2010 Overall Quality Control Assessment

Appendix 1-E1
2010 Overall Quality Control Assessment

1.1 Introduction and Executive Summary

The analytical data generated during the 2010 Phase 1 RCRA Facility Investigation (RFI), Rhodia Silver Bow Plant, Corrective Action Order on Consent, Docket No. RCRA-08-2004-0001 by Columbia Analytical Services, Inc. (CAS), ACZ Laboratories, Inc. (ACZ) and ALS Laboratory Group (ALS) were reviewed and validated in conformance with of the Quality Assurance Project Plan (QAPP, Barr, March 2009).

This Quality Control (QC) assessment is divided into two major sections following this introduction. Section 4.2 provides the QC assessment for the chemical analysis performed by the laboratories. Section 4.3 provides the QC assessment for the field sampling procedures.

The QC assessment of the soil and groundwater sample analytical data collected for the 2010 Phase 1 RFI, Rhodia Silver Bow Plant, demonstrate compliance with the data quality objectives in the QAPP. The analytical results have been validated and determined useable as qualified in the data summary tables and associated databases.

The QC assessment of the field sampling procedures and data demonstrate compliance with the data quality objectives in the QAPP and the Phase I RFI Workplan (Barr, 2009). The field sampling procedures were appropriate. No introduction of contamination or negative effects on sample representativeness was observed.

1.2 Laboratory Analyses

Columbia Analytical Services Inc. (CAS) located in Kelso, Washington conducted the physical preparation and chemical analyses of the analytical samples requiring polychlorinated biphenyls (PCBs), metals, and general chemistry analyses. ACZ Laboratories, Inc. (ACZ) located in Steamboat Springs, Colorado conducted the radiological analyses, and ALS Laboratory Group (ALS) located in Salt Lake City, Utah conducted the physical preparation and analysis of the analytical samples requiring elemental phosphorus analysis by modified EPA 7580 as set forth in the QAPP.

As set forth in Section B10.3.2 of the QAPP, 10% of the analytical data were validated in accordance with U.S. EPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic and Inorganic Data Review, (2005/2004) (Guidelines). Areas evaluated during the data validation process include holding times, initial and continuing instrument calibrations, surrogate and internal standard recoveries, laboratory control samples (LCS), matrix spike sample (MS) and matrix spike duplicate sample (MSD) data, laboratory duplicate sample data, laboratory method blank sample data and an overall assessment of the data. For the remaining data, the areas evaluated during the data validation process were focused to holding times, initial and continuing calibration summary data (where available), LCS, MS and MSD data, laboratory duplicate sample data, laboratory method blank sample data and an overall assessment of the data. In addition to the Guidelines, specific method criteria (SW-846) were also considered in the validation process as differences in some of the performance aspects exist between the Guidelines and the non-CLP methods used for the sample analysis. No Guidelines exist for the validation of radiological data, elemental phosphorus and general chemistry (chloride, fluoride, sulfate, ammonia, nitrate + nitrite, total phosphorus, bicarbonate and carbonate alkalinity,); therefore, a data quality review was performed to evaluate general conformity with the performance aspects of the individual analytical methods. As required by the United States Environmental Protection Agency (EPA), soil samples, results from the PCBs, metals, fluoride, and elemental phosphorus analyses were evaluated to the MDL. Where applicable, the PCBs, metals, fluoride, and elemental phosphorus data greater than the MDL and below the practical quantitation limit (PQL) are flagged with a "J" indicating an estimated concentration.

1.2.1 Laboratory Report Data Validation Summaries

Results from the analysis of soil and groundwater samples collected for the 2010 Phase 1 RCRA Facility Investigation, Rhodia Silver Bow Plant, Corrective Action Order on Consent, Docket No. RCRA-08-2004-0001 are included in the following laboratory reports:

Columbia Analytical Services, Inc. Data Packages		
K1006615	K1006636	K1006676
K1006777	K1006867	K1007395
ALS Laboratory Group Data Packages		
1020002		

* ACZ Laboratories, Inc. data is contained within Columbia Analytical Services, Inc. data packages.

The individual data evaluations for the laboratory reports listed above are provided in Appendix Q-2. This assessment provides an overview of the overall quality control aspects of the project data. The data validation reports contain more specific details regarding the application of sample qualifiers assigned during the validation process. The laboratory data are considered to be usable as qualified in the data summary tables and databases.

1.2.2 Overview of Quality Control Assessment

The Data Quality Objectives of 95% completeness were achieved (Section A9.2.3 of the QAPP).

The following is a general summary of the QC assessment of the analytical results of project samples performed by CAS, ACZ and ALS. Deviations in the quality control aspects discussed in detail below are limited to those QC issues considered to be significant. Individual data evaluations provide specific results of the validation and subsequent data qualification (provided in Appendix Q-2).

The project samples were analyzed for one or more of the following parameter(s)/groups: polychlorinated biphenyl (PCB) aroclors, metals, chloride, sulfate, ammonia, nitrate + nitrite, total phosphorus, bicarbonate and carbonate alkalinity, fluoride, percent solids, elemental (white) phosphorus and radiological compounds as described in Tables 1-1, 1-2, 1-3, 1-4, and 1-5 of the QAPP.

No deviations to the specified methodologies published in the QAPP occurred.

The laboratories met sample holding time requirements for extraction and analysis. Although there is no published holding time for fluoride soil analysis, the fluoride data for the soil samples contained within sample delivery groups K1006636 and K1006676 are “J” qualified due to the analysis being conducted approximately five months after the samples were collected. The fluoride data associated

with the soil samples in the two sample delivery groups should be considered estimated concentrations. This is detailed within the individual data evaluations located in Appendix Q-2.

With a few exceptions, the samples were received in acceptable condition and properly labeled. Labeling discrepancies were resolved prior to sample preparation and analysis. The samples were received at the laboratories within the acceptable sample temperatures (0 to 6 degrees C).

Instrument initial and continuing calibration data generally met the acceptance criteria. Exceptions include elemental phosphorus analysis. Specific details regarding initial and continuing calibration deviations are described in the individual data evaluation.

The laboratory control sample (LCS) analyses met the relevant acceptance criteria (Section A9.2.2 of the QAPP). Following the request from EPA (via QAPP comments), MS/MSD percent recoveries [1] <30% and >150% force results to be qualified "R" unusable. The LCS spike recoveries for the 2010 soil and groundwater samples were within the EPA recommendations.

Matrix spike (MS) and matrix spike duplicate (MSD) samples were submitted at the frequency specified in the QAPP. Most of the MS/MSD sample results met acceptance criteria for percent recovery and associated relative percent difference (RPD) for each of the required analyses/target compounds (PCBs, metals, chloride, sulfate, ammonia, nitrate + nitrite, total phosphorus, bicarbonate and carbonate alkalinity, fluoride, percent solids, elemental phosphorus and radiological compounds). In the few instances where deviations were observed in specific samples of these matrices, acceptable LCS and LCSD (accuracy and precision) results were achieved, indicating in-control analytical systems during sample analysis. Following the request from EPA (via QAPP comments), MS/MSD percent recoveries [2] <30% and >150% force results to be qualified "R" unusable. The MS spike recoveries for the 2010 soil and groundwater samples were within the EPA

---

[1] Percent recoveries include: laboratory control samples, matrix spike and matrix spike duplicates, surrogate standards, internal standards, interference check samples and initial and continuing calibration standards.

[2] Percent recoveries include: laboratory control samples, matrix spike and matrix spike duplicates, surrogate standards, internal standards, interference check samples and initial and continuing calibration standards.

recommendations. Minor deviations to the applicable MS/MSD laboratory criterion are discussed in detail in the individual data evaluations

Laboratory duplicate data met the relevant acceptance criteria (Section A9.2.1 of the QAPP) for precision with a few exceptions which are discussed in detail in the individual data evaluations. None of the deviations were considered significant or indicate systematic problems with the analytical processes performed.

Surrogate standards (for organic PCB analysis) met the acceptance criteria (Section A9.2.2.2 of the QAPP).

For the metals ICP analysis, interference check sample (ICS) acceptance criterion of +/-20% of the true value were met.

For the metals ICP and ICP/MS analysis, the contract required quantitation limit check standard solution (CRI) percent recoveries for chromium, iron, manganese, sodium did not meet the applicable Guideline criterion; however, no data were qualified because the CRI is not required in Method 6010 and Method 6020.

The majority of the ICP and ICPMS serial dilution data met the applicable criteria with three exceptions; the percent difference for magnesium in sample BG-9 (12-18) COMP; for beryllium and calcium in sample BG-16 (0-2) COMP; and for beryllium in sample BG-2 (2-12) COMP exceeded the laboratory acceptance limits and were qualified "J" estimated.

The ICPMS and mercury post-digestion spike data met the applicable criteria. A post-digestion spike for ICP analysis was not performed.

A minor deviation was made from the Guidelines relative to the affect of detected blank sample results on corresponding project sample results. In general, the Guidelines indicate that when sample concentrations are detected at or near the concentrations detected in the blank samples, the results should be presented as the CRQL/RL, with a corresponding "<" (less than) or U qualifier. However, the CRQLs are far greater than the final laboratory PQLs set forth in the QAPP. Therefore, when a project sample result is less than 5 times the associated blank sample concentration, the project sample result is reported with a "<" or U (EPA 2005 Organic Guidelines) qualifier.

Many target compounds were detected at very low concentrations in the laboratory method blank samples, no significant-gross-system-contamination issues were identified over the course of the analytical events. Samples impacted by blank sample concentrations have been qualified and are detailed in the individual data evaluations provided in Appendix Q-2.

1.3 Field Sampling

1.3.1 Field Sampling Quality Control

Field sampling procedures were performed in accordance with the Phase 1 RFI Work Plan (Barr, 2009).

Field quality control procedures included the collection and analysis of field duplicate samples and field blank samples to monitor the contamination introduced from improper field equipment decontamination, sample collection, sample transport, and laboratory analytical procedures. The results from the analysis of these samples demonstrate that the data are in compliance with the data quality objectives.

Sample identification techniques described in Sections A9 and B2 of the QAPP (Barr, March 2009) required the field (rinsate) blank samples be submitted to the laboratory as blind QC samples; therefore, the field blank samples were assigned a fictitious soil location name at the time of collection and their true identities were documented in the Field Logbook records. Field blank samples were collected in the following manner: The soil sampling equipment (i.e. stainless-steel bowl, and/or spoon, etc.) were rinsed with analyte-free, deionized water. The rinse water was poured into the appropriate sample containers for analysis. The data is presented in the data summary tables using the soil sample locations they were collected from along with the fictitious sample locations identified on the chain-of-custody forms.

Field sampling procedures and protocols were determined to be appropriate. As described in the QAPP, blank samples associated with the soil sampling were analyzed for corresponding sample analysis (PCBs, metals, chloride, sulfate, ammonia, nitrate + nitrite, total phosphorus, bicarbonate and carbonate alkalinity, fluoride, percent solids, elemental phosphorus and radiological compounds). Although several field blank samples had low levels of target analytes present below or near the MDL/PQL, no introduction of gross contamination or other adverse affects on sample representativeness were identified. The field blank sample results are summarized Appendix Q-4b and are detailed within the individual data evaluations in Appendix Q-2.

A total of four field duplicate samples were collected as specified in Section A9.3.2 of the QAPP. Precision (both field and analytical) was evaluated through a comparison of the duplicate data when both the native and duplicate sample had detected concentrations reported.

The precision was evaluated by calculating the relative percent difference (RPD) for the data pairs as follows:

$$RPD = \frac{D_1 - D_2}{(D_1 + D_2)/2} \times 100$$

Where: D_1 = concentration of sample
D_2 = concentration of duplicate sample

The RPD results for arsenic, cadmium, mercury, sodium, lead 210, radium 228, thorium 230, and uranium 234, 235 and 238 fell beyond the 40% criteria in one or more of the field duplicate pairs. However, RPD results are dependent on the heterogeneity of the samples. Higher RPDs are expected when results are at or near the PQL and do not always indicate poor precision. Data qualifiers were applied due RPD exceedences in only one case, and the data are qualified accordingly in the data summary tables. The field duplicate sample results are discussed in detail within the individual data evaluations.

Appendix 1-E2

2010 Individual Data Assessments

Data Validation Report
Laboratory Report / Batch: K1006615

Rhodia Silver Bow Plant – Butte, Montana
2010 – Phase I RCRA Facility Investigation
U.S. EPA Corrective Action Order on Consent,
Docket No. RCRA-2006-08-2004-0001

Date of Data Validation Report: January 26, 2011

The validation of the Columbia Analytical Services, Inc. (CAS, Kelso, Washington) and ACZ Laboratories, Inc. (ACZ, Steamboat Springs, Colorado) laboratory data for metals, general chemistry, and radiochemistry analyses of the samples collected in 2010 to support the Phase 1 - RCRA Facility Investigation is complete as detailed below.

The analytical data were reviewed in accordance Barr's Data Validation SOPs which are based upon the U.S. EPA Contract Laboratory Program (CLP) National Functional Guidelines (NFG) for Inorganic Data Review (EPA 2004) and in general accordance with U.S. EPA Methods 160.3 modified, 340.2 modified, 6010B, 6020, 7471A; 9315 modified; modified EICHROM method for lead 210 and uranium 234, 235 and 238 isotope analysis; and the Department of Energy's Environmental Survey Manual Method 4506 (ESM 4506) as specified in the Quality Assurance Project Plan (QAPP, Barr, March 2009).

In general, the areas covered by the validation process include:

- Overall assessment
- Holding times, preservation and storage
- Instrument performance checks - ICP/MS Tuning
- Initial calibration and initial calibration verification
- Continuing calibration verification
- Blank analysis
- ICP/ICP/MS interference check samples (metals only)
- Laboratory control samples
- Internal standards
- Matrix spike results

The results for nine soil samples are contained in this laboratory report. The samples are identified as follows:

BG-5 (0-2) COMP	BG-5 (2-12) COMP	BG-5 (12-18) COMP
BG-9 (0-2) COMP	BG-9 (2-12) COMP	BG-9 (12-18) COMP
BG-13 (0-2) COMP	BG-13 (2-12) COMP	BG-13 (12-18) COMP

The samples were analyzed for metals (ICP/ICP/MS/mercury), general chemistry parameters (total solids and fluoride) and radiochemistry parameters (uranium 234 and 238, radium 226, lead 210, and thorium 230) as required using the methods detailed in the QAPP (Barr, March 2009).

Overall Assessment

The QAPP specified that 10% of the project data be reviewed using CLP NFG (Guidelines) and the remaining data be reviewed in accordance with Barr's Data Validation Standard Operating Procedures (SOPs). Because 90% of the data was correspondingly validated using non-CLP criteria, the laboratory criterion were used for consistency, except where outliers exceeded 30-150% EPA

quality control criteria. In summary, because the Guidelines have limits which are often different than, and in certain cases are more stringent than, the limits specified by the analytical methods and the laboratory generated limits; therefore, the end result may be slightly different data qualification.

In accordance with the Guidelines, sample concentrations greater than the method detection limit and below the practical quantitation limit are "J" qualified for the metals and fluoride analyses. The data qualifiers indicate estimated concentrations for the analyses. The non-detect concentrations are presented as "<MDL" in the data tables.

The data are useable as reported and qualified and fulfill the data quality objectives (DQOs) for sensitivity, accuracy and precision as specified in the QAPP. The following sections provide specific validation details.

Holding Times, Preservation and Storage

The samples were collected on June 22nd, 2010 packed on ice and sent to the laboratories (CAS, located in Kelso, Washington and ACZ, located in Steamboat Springs, CO) with an accompanying chain-of-custody form (COC). Per the chain-of-custody and subsequent laboratory acknowledgement receipt forms, the samples were received intact with a temperature of 1.0 °C to 3.7 °C upon receipt at the laboratories. The samples were stored at 4 °C until analysis. No qualifiers were assigned due to holding times, preservation, or storage issues.

Instrument Performance Checks – ICP/MS Tuning (ICP/MS Metals)

Satisfactory instrument calibration is crucial to ensuring the accurate qualitative and quantitative results for the target compound of the analysis. Initial calibration procedures define the linear range and mean calibration factors that are used for sample quantitation.

The tuning aspects of the inductively coupled plasma mass spectrometer (ICP/MS) met the applicable acceptance criteria for mass resolution and the percent relative standard deviation (%RSD) for the five consecutive replicates at <5%.

Initial Calibration and Initial Calibration Verification

The ICP and ICP/MS initial calibrations were performed at the appropriate frequency and run order, and met minimum percent recovery (%R) acceptance criteria for each of the target metals. Mean concentrations from 2 replicate exposures were reported for ICP and from 3 replicate exposures for ICP/MS as required. Initial calibration verification (ICV) criterion of ±10% (of true value) for the target analytes was met during the initial calibration events.

The cold vapor mercury initial calibration events met the acceptance criterion of a correlation coefficient >0.995 using a minimum of at least four calibration standard solutions. The ICV criterion of 20% of the true value was also met for the cold vapor mercury analysis.

Continuing Calibration Verification

The CCVs for the ICP and ICP/MS analyses met data validation criteria for frequency, run order and acceptable percent recoveries were achieved within the analytes' method detection limit and the

documented upper linear range of the instrument. Mean concentrations from the 2 (for ICP) and 3 (for ICPMS) replicate exposures were reported as required.

The CCVs associated with the cold vapor mercury analyses met the established acceptance criteria for frequency and the calculated percent recovery of 20% of the true value.

The Contract Required Quantitation Limit (CRQL) Check Standard (CRI) sample data for ICP, ICP/MS, and mercury did not met the data validation criteria for frequency, run order and/or percent recovery as dictated in the Guidelines. The CRI samples reported in the data packages were analyzed at the beginning of the analytical sequence(s). The percent recoveries for ICP, ICPMS and mercury met the percent recovery criterion established in the Guidelines.

Blank Analysis

As stated in Section B10.3.2 of the QAPP, when project sample concentrations are "<" (less than) five times the associated blank sample concentrations, thus suspected false positives, they are shown at the concentration reported in the sample, with a "<"qualifier analyses with the exception of the radiochemistry analyses detailed below.

The ICP, ICP/MS and mercury analyses method blank samples, initial calibration blank (ICB) and continuing calibration blank samples (CCBs) were prepared and analyzed at the appropriate frequency and met acceptance criteria for proper run order. Trace concentrations of beryllium, iron, manganese, and zinc were detected above the MDL in one method blank sample; however, no data were qualified because the soil sample concentrations were all greater than five times the method blank sample concentration. Although one or more target metal analytes were present in the ICBs or CCBs, their concentrations were extremely low (at or near the MDL) and do not indicate significant system contamination. No qualifiers were applied due to trace ICB or CCB concentrations.

ICP/ICP/MS Interference Check Samples (Metals Only)

The ICP and ICP/MS interference check samples (ICS) were analyzed at the appropriate frequency and in the correct order during the analysis of the project samples. Acceptable results of ± 20% of the true value were obtained for both solution A and solution AB.

Laboratory Control Samples (Ongoing Precision/Accuracy)

Laboratory control samples (LCSs) were prepared and analyzed at the appropriate frequency for the target compounds and met the relevant acceptance criteria for percent recovery of the spike concentrations, indicating in-control analytical systems.

The laboratory met the acceptance criteria for the ICP and ICPMS serial dilutions (≤ 10 %D), between the undiluted and diluted results, where sample results are significantly greater than the MDL (>50x) with the exception of magnesium. The ICP serial dilution for magnesium for sample BG-9 (12-18) COMP exceeded the acceptance limits specified by the laboratory and the Guidelines and were "J" qualified (estimated). A post-digestion spike for ICP analyses was not performed. The ICP/MS and mercury serial dilutions and post-digestion spike percent recoveries met the applicable criteria.

Internal Standards (ICP/MS Analyses Only)

The ICP/MS internal standard data were acceptable. The ICP/MS internal standard data were acceptable. The internal standards displayed percent relative intensity (%RI) within the 60-125% range.

Matrix Spike Results

Sample BG-9 (12-18) COMP served as the MS samples for the ICP, ICP/MS, and mercury analyses. The MS data met the applicable laboratory and EPA acceptance criteria for percent recovery with the following exception. The MS percent recovery for iron for sample BG-9 (12-18) COMP served was not applicable because the associated sample concentration was greater than four times the spike concentration thereby preventing accurate evaluation of the spike recovery.

General Chemistry Analysis (Fluoride and Total Solids)

No Guideline criteria exist for fluoride and total solids analyses. The general chemistry data were reviewed in accordance with Barr's SOPs included in the QAPP. Results for total solids were accepted as reported. The ICV, CCV data indicated that the laboratory and method criteria were met for fluoride. Sample BG-9 (12-18) COMP served as the MS/MSD samples for the fluoride analysis. In all but one case, the LCS and MS/MSD data indicated that the applicable laboratory and method criteria were met for the general chemistry analyses. For sample BG-9 (12-18) COMP, the MSD percent recovery did not meet the acceptable laboratory criteria; however, no data were qualified because the deviation was minor (1% below the laboratory criteria). Samples BG-9 (12-18) COMP served as the analytical batch duplicate sample for the general chemistry analyses. The analytical batch duplicate sample data indicated that the laboratory and method criteria were met for the general chemistry analyses. Trace concentrations of fluoride were present above the MDL in one or more of the method blank and CCB samples; however, no data were qualified because the blank sample concentrations were too small to have an affect on the associated project soil samples.

Radiochemistry Analysis (Lead 210, Radium 226, Thorium 230, and Uranium 234, 235 and 238)

Results were reviewed in general accordance with the analytical methods specified in the QAPP. Samples BG-10 (0-2) COMP, BG-10 (2-12) COMP, and BG-10 (12-18) COMP served as the MS samples for one or more of the radiochemistry methods. The LCS and MS data met the applicable criterion for accuracy. Samples BG-10 (0-2) COMP, BG-10 (2-12) COMP, and BG-10 (12-18) COMP served as the analytical batch duplicate samples for this data package. The replicate error ratios (RERs) met the laboratory acceptance limits for precision. One method blank sample had a detectable concentration above the practical quantitation limit (i.e. lower limit of detection (LLD) for uranium 234; however, per guidance from the laboratory (ACZ), method blank concentrations less than two times the practical quantitation limit are not controlled; therefore, no qualification of the data was deemed necessary.

Discussion

The analytical batch duplicate sample RPDs met the applicable laboratory criteria with the exception of uranium for sample BG-9 (12-18) COMP; therefore, the associated data was "J" qualified and should be considered estimated.

Data Validation Report
Laboratory Report / Batch: K1006636

Rhodia Silver Bow Plant – Butte, Montana
2010 – Phase I RCRA Facility Investigation
U.S. EPA Corrective Action Order on Consent,
Docket No. RCRA-2006-08-2004-0001

Date of Data Validation Report: January 26, 2011

The validation of the Columbia Analytical Services, Inc. (CAS, Kelso, Washington) and ACZ Laboratories, Inc. (ACZ, Steamboat Springs, Colorado) laboratory data for the metals, general chemistry, and radiochemistry analyses of the samples collected in 2010 to support the Phase 1 - RCRA Facility Investigation is complete as detailed below.

The analytical data were reviewed in accordance Barr's Data Validation SOPs which are based upon the U.S. EPA Contract Laboratory Program (CLP) National Functional Guidelines (NFG) for Inorganic Data Review (EPA 2004) and in general accordance with U.S. EPA Methods 160.3 modified, 340.2 modified, 340.2, 6010B, 6020, 7470A, 7471A, 9315 modified; modified EICHROM method for lead 210 and uranium 234, 235 and 238 isotope analysis; and the Department of Energy's Environmental Survey Manual Method 4506 (ESM 4506) as specified in the Quality Assurance Project Plan (QAPP, Barr, March 2009).

In general, the areas covered by the validation process include:

- Overall assessment
- Holding times, preservation and storage
- Summary calibration information
- Blank analysis
- ICP/ICP/MS interference check samples (Metals only)
- Laboratory control samples
- Matrix spike results
- Field blank samples

The results for six soil samples and two aqueous field blank samples are contained in this laboratory report. The samples are identified as follows:

BG-10 (0-2) COMP	BG-10 (2-12) COMP	BG-10 (12-18) COMP
BG-14 (0-2) COMP	BG-14 (2-12) COMP	BG-14 (12-18) COMP
BG-121 COMP (Field Blank)	BG-122 COMP (Field Blank)	

The samples were analyzed for metals (ICP/ICP/MS/mercury), general chemistry parameters (total solids and fluoride) and radiochemistry parameters (uranium 234 and 238, radium 226, lead 210, and thorium 230) as required using the methods detailed in the QAPP (Barr, March 2009).

Overall Assessment

The QAPP specified that 10% of the project data be reviewed using CLP NFG (Guidelines) and the remaining data be reviewed in accordance with Barr's Data Validation Standard Operating Procedures (SOPs). Because 90% of the data was correspondingly validated using non-CLP criteria, the laboratory criterion were used for consistency, except where outliers exceeded 30-150% EPA quality control criteria. In summary, because the Guidelines have limits which are often different

than, and in certain cases are more stringent than, the limits specified by the analytical methods and the laboratory generated limits; therefore, the end result may be slightly different data qualification.

In accordance with the Guidelines, sample concentrations greater than the method detection limit and below the practical quantitation limit are "J" qualified for the fluoride and metals analyses. The data qualifiers indicate estimated concentrations for the analyses. The non-detect concentrations are presented as "<MDL" in the data tables.

The data are useable as reported and qualified and fulfill the data quality objectives (DQOs) for sensitivity, accuracy and precision as specified in the QAPP. The following sections provide specific validation details.

Holding Times, Preservation and Storage

The samples were collected on June 3rd, 2010, packed on ice and sent to the laboratories (CAS, located in Kelso, Washington and ACZ, located in Steamboat Springs, CO) with an accompanying chain-of-custody form (COC). Per the chain-of-custody and subsequent laboratory acknowledgement receipt forms, the samples were received intact with a temperature of 0.6 °C to 6.0 °C upon receipt at the laboratories. The samples were stored at 4 °C until analysis.

Due to a miscommunication within the laboratory, the soil samples associated within this data package were extracted using the Bellack distillation procedure (EPA Method 340.1 modified) and not the distilled (DI) water distillation procedure required for the project's fluoride analysis. Following the discovery of this error, the laboratory prepared and analyzed the remaining soil samples (still refrigerated at 4 °C) for fluoride using the correct analytical method. This preparation and analysis took place on November 18th, 2010 approximately five months after the samples were collected. Although there is no published holding time for fluoride analysis of soil, the laboratory performed a small study to determine what if any effect this five month lag time had on the analytical results. This study included the reanalysis of several soil samples that were analyzed approximately five months earlier using the correct procedure, and comparing these new results with the initial data. The results indicated that there is a noticeable decrease (approximately 60% lower) in the detectable values of fluoride between the original analysis and the reanalysis. Based on this, the soil sample results for fluoride within this sample delivery group are "J" qualified and should be considered estimated based upon the results of this study. No other qualifiers were assigned due to holding times, preservation, or storage issues.

Summary Calibration Information

The initial calibration (ICAL), continuing calibration (CCAL), initial calibration verification (ICV) and continuing calibration verifications (CCVs) are not QC elements for non-CLP data evaluation. Since the calibration data were provided in summary form within the laboratory report, the data, where available, were reviewed as part of the non-CLP data evaluation process but confirmation via raw data review was not performed.

The ICP, ICPMS and mercury ICVs and CCVs met the established laboratory acceptance criterion.

Blank Analysis

As stated in Section B10.3.2 of the QAPP, when project sample concentrations are "<" (less than) five times the associated blank sample concentrations, thus suspected false positives, they are shown at the concentration reported in the sample, with a "<"qualifier with the exception of the radiochemistry analyses detailed below.

Although not part of the non-CLP data review, one or more of the following blank samples (initial calibration blank (ICB) and continuing calibration blank (CCBs) were evaluated when provided in summary form within the laboratory report but confirmation via raw data was not performed. The ICP, ICP/MS, and mercury analyses ICB and CCBs met acceptance criteria for proper run order and the target metal analytes were less than the CRQL. Although one or more target metal analytes were present in the ICBs or CCBs, their concentrations were extremely low (at or near the MDL) and do not indicate significant system contamination. No qualifiers were applied due to trace ICB or CCB concentrations.

The method blank samples associated with the ICP, ICP/MS and mercury analytical batches were prepared and analyzed at the appropriate frequency. Trace concentrations of beryllium, iron, magnesium and zinc were detected above the MDL in the soil method blank sample; however, no data were qualified because the soil sample concentrations were all greater than five times the method blank sample concentrations. Beryllium, calcium and copper were detected above the MDL in the method blank sample associated with the aqueous batch. Since this aqueous method blank sample is only associated field blank samples BG-121 COMP and BG-122 COMP, no data were qualified based upon this method blank sample because the field blank sample concentrations are required to be presented as stated in the laboratory report for the data evaluation process.

ICP/ICP/MS Interference Check Samples (Metals Only)

The interference check sample (ICS) and contract required quantitation limit standard (CRI/CRA) data review is not a QC element for non-CLP evaluation but the ICS and CRI data were evaluated when provided in summary form within the laboratory report but confirmation via raw data review was not performed. The ICP and ICPMS ICSs met the laboratory acceptance criteria for both solution A and solution AB. The CRI percent recoveries for ICPMS and mercury met the percent recovery criterion established in the Guidelines. The ICP CRI percent recovery for chromium, iron and sodium did not meet the acceptance limits specified in the Guidelines for the aqueous analytical run. Since Method 6010B does not require CRI analysis, qualifiers were not applied to the ICP data.

Laboratory Control Samples (Ongoing Precision/Accuracy)

Laboratory control samples (LCSs) were prepared and analyzed at the appropriate frequency for the target compounds and met the relevant acceptance criteria for percent recovery of the spike concentrations, indicating in-control analytical systems.

The laboratory met the acceptance criteria for the ICP serial dilutions (≤ 10 %D), between the undiluted and diluted results, where sample results are significantly greater than the MDL (>50x) with two exceptions. The serial dilution for magnesium for sample BG-9 (12-18) COMP exceeded the acceptance limits specified by the laboratory and the Guidelines and was "J" qualified

(estimated). The serial dilution for uranium exceeded the laboratory acceptance limits and the Guidelines; however, no data were qualified because the sample used for this serial dilution was not a project sample. A post-digestion spike for ICP analyses was not performed. The ICP/MS and mercury serial dilutions and post-digestion spike percent recoveries met the applicable criteria.

Matrix Spike Results

Samples BG-9 (12-18) COMP and non-project specific samples served as the MS samples for the ICP, ICP/MS, and mercury analyses. The MS data met the applicable laboratory and EPA acceptance criteria for percent recovery. The MS percent recoveries for iron for sample BG-9 (12-18) COMP and a non-project specific sample were not applicable because the associated sample concentrations were greater than four times the spike concentration thereby preventing accurate evaluation of the spike recovery.

General Chemistry Analysis (Fluoride and Total Solids)

No Guideline criteria exist for fluoride and total solids analyses. The general chemistry data were reviewed in accordance with Barr's SOPs included in the QAPP. Results for percent solids were accepted as reported. Samples BG-10 (0-2) COMP and non-project specific samples served as the MS/MSD samples for the fluoride analysis. The MS/MSD percent recoveries met the applicable acceptance criteria. Sample BG-10 (0-2) COMP and non-project specific samples served as the laboratory duplicate sample for the general chemistry analyses and the percent recovery met the applicable laboratory criteria for precision. The ICV, CCV, and LCS data indicated that the laboratory and method criteria were met for fluoride analysis. Trace concentrations of fluoride were present above the MDL in one or more of the laboratory method blank and CCB samples. The fluoride detection for the aqueous method blank sample must be presented as stated in the laboratory report. No data were qualified based upon the CCB sample concentrations because they were too small to have an affect on the associated project samples.

Radiochemistry Analysis (Lead 210, Radium 226, Thorium 230, and Uranium 234 and 238)

Results were reviewed in general accordance with the analytical methods specified in the QAPP. Samples BG-10 (0-2) COMP, BG-10 (2-12) COMP, BG-10 (12-18) COMP, BG-122 COMP and non-project specific samples served as the MS samples for the radiochemistry methods. The LCS and MS percent recoveries met the applicable criterion for accuracy. Samples BG-10 (0-2) COMP, BG-10 (2-12) COMP, BG-10 (12-18) COMP, BG-121 COMP and non-project specific samples served as the analytical batch duplicate samples for this data package. The replicate error ratios (RERs) met the laboratory acceptance limits for precision. One method blank sample had a detectable concentration above the practical quantitation limit (i.e. lower limit of detection (LLD) for uranium 234; however, per guidance from the laboratory (ACZ), method blank concentrations less than two times the practical quantitation limit are not controlled; therefore, no qualification of the data was deemed necessary.

Field Blank Samples

Field blank samples were collected and analyzed at the required frequency as specified in the QAPP. Samples BG-121 COMP and BG-122 COMP served as the field blank samples associated with this sample delivery group. The field blank samples were collected in the following manner: the sample equipment (i.e. stainless steel bowl, etc.) were rinsed with analyte-free, deionized water and the rinse water was poured into the appropriate sample containers for analysis. No target analytes were present above the MDL for metals and fluoride or above the practical quantitation limit for total solids analysis in the field blank sample associated with this data package except where noted below. One or more of the field blank samples had trace concentrations of fluoride, thorium 230 and multiple metals present above the MDL/LLD. The field blank sample data are summarized in Appendix Q-4b. Once these field blank sample concentrations undergo unit conversions (for comparison to mg/kg soil results), the fluoride and metals concentrations are very low and are unlikely to adversely affect final sample results, therefore, no data qualifiers were applied. Due to the nature of the analyses, the radiochemistry field blank sample data were used to evaluate if any gross system contamination occurred. No qualifiers were applied to the samples based upon the thorium 230 field blank sample data.

Discussion

The analytical batch duplicate sample RPDs met the applicable laboratory criteria with the exception of uranium (ICP/MS) for sample BG-9 (12-18) COMP. The associated data was “J” qualified and should be considered estimated where the RPD deviated from the laboratory criterion by more than 5 percent.

Data Validation Report
Laboratory Report / Batch: K1006676

Rhodia Silver Bow Plant – Butte, Montana
2010 – Phase I RCRA Facility Investigation
U.S. EPA Corrective Action Order on Consent,
Docket No. RCRA-2006-08-2004-0001

Date of Data Validation Report: January 28, 2011

The validation of the Columbia Analytical Services, Inc. (CAS, Kelso, Washington) and ACZ Laboratories, Inc. (ACZ, Steamboat Springs, Colorado) laboratory data for the metals, general chemistry, and radiochemistry analyses of the samples collected in 2010 to support the Phase 1 - RCRA Facility Investigation is complete as detailed below.

The analytical data were reviewed in accordance Barr's Data Validation SOPs which are based upon the U.S. EPA Contract Laboratory Program (CLP) National Functional Guidelines (NFG) for Inorganic Data Review (EPA 2004) and in general accordance with U.S. EPA Methods 160.3 modified, 340.2 modified, 6010B, 6020, 7471A, 9315 modified; modified EICHROM method for lead 210 and uranium 234, 235 and 238 isotope analysis; and the Department of Energy's Environmental Survey Manual Method 4506 (ESM 4506) as specified in the Quality Assurance Project Plan (QAPP, Barr, March 2009).

In general, the areas covered by the validation process include:

- Overall assessment
- Holding times, preservation and storage
- Summary calibration information
- Blank analysis
- ICP/ICP/MS interference check samples (Metals only)
- Laboratory control samples
- Matrix spike results
- Field duplicate samples

The results for twenty soil samples are contained in this laboratory report. The samples are identified as follows:

BG-7 (0-2) COMP	BG-7 (2-12) COMP	BG-7 (12-18) COMP
BG-8 (0-2) COMP	BG-8 (2-12) COMP	BG-8 (12-18) COMP
BG-11 (0-2) COMP	BG-11 (2-12) COMP	BG-11 (12-18) COMP
BG-12 (0-2) COMP	BG-12 (2-12) COMP	BG-12 (12-18) COMP
BG-15 (0-2) COMP	BG-15 (2-12) COMP	BG-15 (12-18) COMP
BG-16 (0-2) COMP	BG-16 (2-12) COMP	BG-16 (12-18) COMP

BG-101 (2-12) COMP (BG-8 (2-12) COMP DUP)
BG-102 (2-12) COMP (BG-15 (12-18) COMP DUP)

The samples were analyzed for metals (ICP/ICP/MS/mercury), general chemistry parameters (total solids and fluoride) and radiochemistry parameters (uranium 234, 235 and 238, radium 226, lead 210, and thorium 230) as required using the methods detailed in the QAPP (Barr, March 2009).

Overall Assessment

The QAPP specified that 10% of the project data be reviewed using CLP NFG (Guidelines) and the remaining data be reviewed in accordance with Barr's Data Validation Standard Operating Procedures (SOPs). Because 90% of the data was correspondingly validated using non-CLP criteria, the laboratory criterion were used for consistency, except where outliers exceeded 30-150% EPA quality control criteria. In summary, because the Guidelines have limits which are often different than, and in certain cases are more stringent than, the limits specified by the analytical methods and the laboratory generated limits; therefore, the end result may be slightly different data qualification.

In accordance with the Guidelines, sample concentrations greater than the method detection limit and below the practical quantitation limit are "J" qualified for the fluoride and metals analyses. The data qualifiers indicate estimated concentrations for the analyses. The non-detect concentrations are presented as "<MDL" in the data tables.

The data are useable as reported and qualified and fulfill the data quality objectives (DQOs) for sensitivity, accuracy and precision as specified in the QAPP. The following sections provide specific validation details.

Holding Times, Preservation and Storage

The samples were collected on June 25th through 27th, 2010, packed on ice and sent to the laboratories (CAS, located in Kelso, Washington and ACZ, located in Steamboat Springs, CO) with an accompanying chain-of-custody form (COC). Per the chain-of-custody and subsequent laboratory acknowledgement receipt forms, the samples were received intact with a temperature of 0.3 °C to 4.3 °C upon receipt at the laboratories. The samples were stored at 4 °C until analysis.

Due to a miscommunication within the laboratory, the soil samples associated within this data package were extracted using the Bellack distillation procedure (EPA Method 340.1 modified) and not the distilled (DI) water distillation procedure required for the project's fluoride analysis. Following the discovery of this error, the laboratory prepared and analyzed the remaining soil samples (still refrigerated at 4 °C) for fluoride using the correct analytical method. This preparation and analysis took place on November 18th, 2010 approximately five months after the samples were collected. Although there is no published holding time for fluoride analysis of soil, the laboratory performed a small study to determine what if any effect this five month lag time had on the analytical results. This study included the reanalysis of several soil samples that were analyzed approximately five months earlier using the correct procedure, and comparing these new results with the initial data. The results indicated that there is a noticeable decrease (approximately 60% lower) in the detectable values of fluoride between the original analysis and the reanalysis. Based on this, the soil sample results for fluoride within this sample delivery group are "J" qualified and should be considered estimated based upon the results of this study. No other qualifiers were assigned due to holding times, preservation, or storage issues.

Summary Calibration Information

The initial calibration (ICAL), continuing calibration (CCAL), initial calibration verification (ICV) and continuing calibration verifications (CCVs) are not QC elements for non-CLP data evaluation. Since the calibration data were provided in summary form within the laboratory report, the data, where available, were reviewed as part of the non-CLP data evaluation process but confirmation via raw data review was not performed.

The ICP, ICPMS and mercury ICVs and CCVs met the established laboratory acceptance criterion.

Blank Analysis

As stated in Section B10.3.2 of the QAPP, when project sample concentrations are "<" (less than) five times the associated blank sample concentrations, thus suspected false positives, they are shown at the concentration reported in the sample, with a "<"qualifier with the exception of the radiochemistry analyses detailed below.

Although not part of the non-CLP data review, one or more of the following blank samples (initial calibration blank (ICB) and continuing calibration blank (CCBs) were evaluated when provided in summary form within the laboratory report but confirmation via raw data was not performed. The ICP, ICP/MS, and mercury analyses ICB and CCBs met acceptance criteria for proper run order and the target metal analytes were less than the CRQL. Although one or more target metal analytes were present in the ICBs or CCBs, their concentrations were extremely low (at or near the MDL) and do not indicate significant system contamination. No qualifiers were applied due to trace ICB or CCB concentrations.

The method blank samples associated with the ICP, ICP/MS and mercury analytical batches were prepared and analyzed at the appropriate frequency. Trace concentrations of iron and magnesium were detected above the MDL in the soil method blank sample; however, no data were qualified because the soil sample concentrations were all greater than five times the method blank sample concentrations.

ICP/ICP/MS Interference Check Samples (Metals Only)

The interference check sample (ICS) and contract required quantitation limit standard (CRI/CRA) data review is not a QC element for non-CLP evaluation but the ICS and CRI data were evaluated when provided in summary form within the laboratory report but confirmation via raw data review was not performed. The ICP and ICPMS ICSs met the laboratory acceptance criteria for both solution A and solution AB. The CRI percent recoveries for ICP, ICPMS and mercury met the percent recovery criterion established in the Guidelines.

Laboratory Control Samples (Ongoing Precision/Accuracy)

Laboratory control samples (LCSs) were prepared and analyzed at the appropriate frequency for the target compounds and met the relevant acceptance criteria for percent recovery of the spike concentrations, indicating in-control analytical systems.

The laboratory met the acceptance criteria for the ICP serial dilutions (≤ 10 %D), between the undiluted and diluted results, where sample results are significantly greater than the MDL (>50x) with two exceptions. The serial dilution for beryllium and calcium for sample BG-16 (0-2) COMP exceeded the acceptance limits specified by the laboratory and the Guidelines and were "J" qualified (estimated). A post-digestion spike for ICP analyses was not performed. The ICP/MS and mercury serial dilutions and post-digestion spike percent recoveries met the applicable criteria.

Matrix Spike Results

Sample BG-16 (0-2) COMP served as the MS samples for the ICP, ICP/MS, and mercury analyses. The MS data met the applicable laboratory and EPA acceptance criteria for percent recovery. The MS percent recoveries for iron and manganese for sample BG-16 (0-2) COMP were not applicable because the associated sample concentrations were greater than four times the spike concentration thereby preventing accurate evaluation of the spike recovery.

General Chemistry Analysis (Fluoride and Total Solids)

No Guideline criteria exist for fluoride and total solids analyses. The general chemistry data were reviewed in accordance with Barr's SOPs included in the QAPP. Results for percent solids were accepted as reported. Sample BG-7 (0-2) COMP served as the MS/MSD samples for the fluoride analysis. The MS/MSD percent recoveries met the applicable acceptance criteria. Sample BG-7 (0-2) COMP served as the laboratory duplicate sample for the fluoride analyses and the percent recovery met the applicable laboratory criteria for precision. The ICV, CCV, and LCS data indicated that the laboratory and method criteria were met for fluoride analysis. Trace concentrations of fluoride were present above the MDL in one or more of the laboratory method blank and CCB samples. The fluoride detection for the method blank sample must be presented as stated in the laboratory report. No data were qualified based upon the method blank sample detection because the associated samples were already "J" qualified based upon the date of analysis (discussed previously). No data were qualified based upon the CCB sample concentrations because they were too small to have an affect on the associated project samples.

Radiochemistry Analysis (Lead 210, Radium 226, Thorium 230, and Uranium 234 and 238)

Results were reviewed in general accordance with the analytical methods specified in the QAPP. Sample BG-11 (12-18) COMP served as the MS sample for the radiochemistry methods. The LCS and MS percent recoveries met the applicable criterion for accuracy. Samples BG-7 (0-2) COMP and BG-16 (12-18) COMP served as the analytical batch duplicate samples for this data package. The replicate error ratios (RERs) met the laboratory acceptance limits for precision. The method blank samples had no detectable concentrations above the practical quantitation limit (i.e. lower limit of detection (LLD) for the target radiochemistry analytes.

Field Duplicate Samples

Field duplicate samples were collected and analyzed as required by the QAPP. Sample BG-101 (2-12) COMP and BG-102 (2-12) COMP served as the field duplicate sample for this data package. Field duplicate soil samples met the RPD criteria (40%) as specified in the QAPP with the exception

of arsenic, mercury, sodium, lead 210, thorium 230, uranium 238. Arsenic was "J" qualified (estimated) based upon the RPD deviation for sample BG-15 (2-12) COMP and its corresponding field duplicate sample (BG-102 (2-12) COMP). No other data were qualified based upon the field duplicate RPDs because sample concentrations near the MDL can exaggerate the deviation of the RPD. However, since the field duplicate sample concentrations for lead 210, thorium 230, uranium 238 were within five times the practical quantitation limit (i.e. lower limit of detection (LLD), no qualifiers were deemed necessary.

Data Validation Report
Laboratory Report / Batch: K1006777

Rhodia Silver Bow Plant – Butte, Montana
2010 – Phase I RCRA Facility Investigation
U.S. EPA Corrective Action Order on Consent,
Docket No. RCRA-2006-08-2004-0001

Date of Data Validation Report: November 12, 2010

The validation of the Columbia Analytical Services, Inc. (CAS, Kelso, Washington) and ACZ Laboratories, Inc. (ACZ, Steamboat Springs, Colorado) laboratory data for the metals, general chemistry, and radiochemistry analyses of the samples collected in 2010 to support the Phase 1 - RCRA Facility Investigation is complete as detailed below.

The analytical data were reviewed in accordance Barr's Data Validation SOPs which are based upon the U.S. EPA Contract Laboratory Program (CLP) National Functional Guidelines (NFG) for Inorganic Data Review (EPA 2004) and in general accordance with U.S. EPA Methods 160.3 modified, 340.2 modified, 340.2, 6010B, 6020, 7470A, 7471A, 903.1 modified, 9315 modified; modified EICHROM method for lead 210 and uranium 234, 235 and 238 isotope analysis; and the Department of Energy's Environmental Survey Manual Method 4506 (ESM 4506) as specified in the Quality Assurance Project Plan (QAPP, Barr, March 2009).

In general, the areas covered by the validation process include:

- Overall assessment
- Holding times, preservation and storage
- Summary calibration information
- Blank analysis
- ICP/ICP/MS interference check samples (Metals only)
- Laboratory control samples
- Matrix spike results
- Field duplicate samples
- Field blank samples

The results for sixteen soil samples and one aqueous field blank sample are contained in this laboratory report. The samples are identified as follows:

BG-1 (0-2) COMP	BG-1 (2-12) COMP	BG-1 (12-18) COMP
BG-2 (0-2) COMP	BG-2 (2-12) COMP	BG-2 (12-18) COMP
BG-3 (0-2) COMP	BG-3 (2-12) COMP	BG-3 (12-18) COMP
BG-4 (0-2) COMP	BG-4 (2-12) COMP	BG-4 (12-18) COMP
BG-6 (0-2) COMP	BG-6 (2-12) COMP	BG-6 (12-18) COMP
BG-100 (0-2) COMP (BG-1 0-2 COMP DUP)		BG-120 COMP (Field Blank)

The samples were analyzed for metals (ICP/ICP/MS/mercury), general chemistry parameters (total solids and fluoride) and radiochemistry parameters (uranium 234 and 238, radium 226, lead 210, and thorium 230) as required using the methods detailed in the QAPP (Barr, March 2009).

Overall Assessment

The QAPP specified that 10% of the project data be reviewed using CLP NFG (Guidelines) and the remaining data be reviewed in accordance with Barr's Data Validation Standard Operating Procedures (SOPs). Because 90% of the data was correspondingly validated using non-CLP criteria, the laboratory criterion were used for consistency, except where outliers exceeded 30-150% EPA quality control criteria. In summary, because the Guidelines have limits which are often different than, and in certain cases are more stringent than, the limits specified by the analytical methods and the laboratory generated limits; therefore, the end result may be slightly different data qualification.

In accordance with the Guidelines, sample concentrations greater than the method detection limit and below the practical quantitation limit are "J" qualified for the fluoride and metals analyses. The data qualifiers indicate estimated concentrations for the analyses. The non-detect concentrations are presented as "<MDL" in the data tables.

The data are useable as reported and qualified and fulfill the data quality objectives (DQOs) for sensitivity, accuracy and precision as specified in the QAPP. The following sections provide specific validation details.

Holding Times, Preservation and Storage

The samples were collected on June 28th through June 30th, 2010, packed on ice and sent to the laboratories (CAS, located in Kelso, Washington and ACZ, located in Steamboat Springs, CO) with an accompanying chain-of-custody form (COC). Per the chain-of-custody and subsequent laboratory acknowledgement receipt forms, the samples were received intact with a temperature of -0.5 °C to 4.7 °C upon receipt at the laboratories. The samples were stored at 4 °C until analysis. No qualifiers were assigned due to holding times, preservation, or storage issues.

Summary Calibration Information

The initial calibration (ICAL), continuing calibration (CCAL), initial calibration verification (ICV) and continuing calibration verifications (CCVs) are not QC elements for non-CLP data evaluation. Since the calibration data were provided in summary form within the laboratory report, the data, where available, were reviewed as part of the non-CLP data evaluation process but confirmation via raw data review was not performed.

The ICP, ICPMS and mercury ICVs and CCVs met the established laboratory acceptance criterion.

Blank Analysis

As stated in Section B10.3.2 of the QAPP, when project sample concentrations are "<" (less than) five times the associated blank sample concentrations, thus suspected false positives, they are shown at the concentration reported in the sample, with a "<"qualifier with the exception of the radiochemistry analyses detailed below.

Although not part of the non-CLP data review, one or more of the following blank samples (initial calibration blank (ICB) and continuing calibration blank (CCBs) were evaluated when provided in summary form within the laboratory report but confirmation via raw data was not performed. The ICP, ICP/MS, and mercury analyses ICB and CCBs met acceptance criteria for proper run order and the target metal analytes were less than the CRQL. Although one or more target metal analytes were present in the ICBs or CCBs, their concentrations were extremely low (at or near the MDL) and do not indicate significant system contamination. No qualifiers were applied due to trace ICB or CCB concentrations.

The method blank samples associated with the ICP, ICP/MS and mercury analytical batches were prepared and analyzed at the appropriate frequency. Trace concentrations of iron, magnesium, potassium and zinc were detected above the MDL in the soil method blank sample; however, no data were qualified because the soil sample concentrations were all greater than five times the method blank sample concentrations. Chromium, copper and iron were detected above the MDL in the method blank sample associated with the aqueous batch. Since this aqueous method blank sample is only associated with field blank sample BG-120 COMP, no data were qualified based upon this method blank sample because the field blank sample concentrations are required to be presented as stated in the laboratory report for the data evaluation process.

ICP/ICP/MS Interference Check Samples (Metals Only)

The interference check sample (ICS) and contract required quantitation limit standard (CRI/CRA) data review is not a QC element for non-CLP evaluation but the ICS and CRI data were evaluated when provided in summary form within the laboratory report but confirmation via raw data review was not performed. The ICP and ICPMS ICSs met the laboratory acceptance criteria for both solution A and solution AB. The CRI percent recoveries for ICPMS and mercury met the percent recovery criterion established in the Guidelines. The ICP CRI percent recovery for chromium, iron and sodium did not meet the acceptance limits specified in the Guidelines. Since Method 6010B does not require CRI analysis, qualifiers were not applied to the ICP data.

Laboratory Control Samples (Ongoing Precision/Accuracy)

Laboratory control samples (LCSs) were prepared and analyzed at the appropriate frequency for the target compounds and met the relevant acceptance criteria for percent recovery of the spike concentrations, indicating in-control analytical systems.

The laboratory met the acceptance criteria for the ICP serial dilutions (≤ 10 %D), between the undiluted and diluted results, where sample results are significantly greater than the MDL (>50x) with one exception. The serial dilution for beryllium for sample BG-2 (2-12) COMP exceeded the acceptance limits specified by the laboratory and the Guidelines and was "J" qualified (estimated). A post-digestion spike for ICP analyses was not performed. The ICP/MS and mercury serial dilutions and post-digestion spike percent recoveries met the applicable criteria.

Matrix Spike Results

Samples BG-2 (2-12) COMP, BG-120 COMP and non-project specific samples served as the MS samples for the ICP, ICP/MS, and mercury analyses. The MS data met the applicable laboratory and EPA acceptance criteria for percent recovery. The MS percent recoveries for iron, manganese, potassium and sodium for sample BG-2 (2-12) COMP were not applicable because the associated sample concentrations were greater than four times the spike concentration thereby preventing accurate evaluation of the spike recovery.

General Chemistry Analysis (Fluoride and Total Solids)

No Guideline criteria exist for fluoride and total solids analyses. The general chemistry data were reviewed in accordance with Barr's SOPs included in the QAPP. Results for percent solids were accepted as reported. Samples BG-2 (2-12) COMP and BG-120 COMP served as the MS/MSD samples for the fluoride analysis. The MS percent recoveries were below the acceptable laboratory criterion for fluoride for sample BG-2 (2-12) COMP; therefore, the data were "J" qualified (estimated) based upon this deviation. The remaining MS/MSD percent recoveries met the applicable acceptance criteria. Samples BG-2 (2-12) COMP and BG-120 COMP served as the laboratory duplicate samples for the fluoride analysis and its percent recovery met the applicable laboratory criteria for precision. The ICV, CCV, and LCS data indicated that the laboratory and method criteria were met for fluoride analysis. Trace concentrations of fluoride were present above the MDL in one or more of the laboratory method blank and CCB samples. Associated sample concentrations within five times the associated method blank sample concentrations were reported with a "<" or U (2004 Inorganic Guidelines) qualifier. This affected fluoride for samples BG-1 (0-2) COMP, BG-2 (0-2) COMP, BG-100 (0-2) COMP, BG-3 (0-2) COMP, BG-4 (0-2) COMP and BG-4 (2-12) COMP. No data were qualified based upon the CCB sample concentrations because they were too small to have an affect on the associated project soil samples.

Radiochemistry Analysis (Lead 210, Radium 226, Thorium 230, and Uranium 234 and 238)

Results were reviewed in general accordance with the analytical methods specified in the QAPP. Samples BG-120 COMP, BG-1 (2-12) COMP, BG-1 (12-18) COMP, BG-6 (0-2) COMP, BG-6 (12-18) COMP, and non-project specific samples served as the MS samples for the radiochemistry methods. Except for one case, the LCS and MS percent recoveries met the applicable criterion for accuracy. The radium 226 MS percent recovery was <1% above the laboratory criteria, since this sample was not related to the project, no data were qualified. Samples BG-120 COMP, BG-121 COMP, BG-1 (0-2) COMP, BG-6 (2-12) COMP, BG-6 (12-18) COMP and non-project specific samples served as the analytical batch duplicate samples for this data package. The replicate error ratios (RERs) met the laboratory acceptance limits for precision with the following exceptions. The RER for radium 226 and uranium 234 and 238 (sample BG-1 (0-2) COMP) and radium 226 (sample BG-6 (12-18) COMP) were above the laboratory criteria for precision; therefore, the associated data were "J" qualified and should be considered estimated concentrations. The method blank samples had no detectable concentrations above the practical quantitation limit (i.e. lower limit of detection (LLD) for the target radiochemistry analytes.

Field Duplicate Samples

Field duplicate samples were collected and analyzed in accordance with the frequency and parameters specified in the QAPP. Sample BG-100 (0-2) COMP (BG-1 (0-2) COMP DUP) served as the field duplicate sample for this data package. Field duplicate soil samples met the RPD criteria (40%) as specified in the QAPP with the exception of cadmium, lead 210, thorium 230, and uranium 234 and 235. Sample concentrations near the MDL can exaggerate the deviation of the RPD as was the case for cadmium; therefore no cadmium data were qualified. However, since the field duplicate sample concentrations for the radiochemical parameters cited above were within five times the practical quantitation limit (i.e. lower limit of detection (LLD), no qualifiers were deemed necessary.

Field Blank Samples

Field blank samples were collected and analyzed at the required frequency as specified in the QAPP. Sample BG-120 COMP served as the field blank sample associated with this sample delivery group. The field blank samples were collected in the following manner: the sample equipment (i.e. stainless steel bowl, etc.) were rinsed with analyte-free, deionized water and the rinse water was poured into the appropriate sample containers for analysis. No target analytes were present above the MDL for metals or above the practical quantitation limit for total solids analysis in the field blank sample associated with this data package except where noted below. The field blank sample had trace concentrations of fluoride, uranium 238 and multiple metals present above the MDL. The field blank sample data are summarized in Appendix Q-4b. Once these field blank sample concentrations undergo unit conversions (for comparison to mg/kg soil results), the fluoride and metals concentrations are very low and are unlikely to adversely affect final sample results, therefore, no data qualifiers were applied. Due to the nature of the analyses, the radiochemistry field blank sample data were used to evaluate if any gross system contamination occurred. No qualifiers were applied to the samples based upon the uranium 238 field blank sample data.

Discussion

The analytical batch duplicate sample RPDs met the applicable laboratory criteria with the exception of manganese and vanadium (ICP) and thallium and uranium (ICP/MS) for sample BG-2 (2-12) COMP. The associated data was “J” qualified and should be considered estimated where the RPD deviated from the laboratory criterion by more than 5 percent. This affects manganese for sample BG-2 (2-12) COMP.

Data Validation Report
Laboratory Report / Batch: K1006867

Rhodia Silver Bow Plant – Butte, Montana
2010 – Phase I RCRA Facility Investigation
U.S. EPA Corrective Action Order on Consent,
Docket No. RCRA-2006-08-2004-0001

Date of Data Validation Report: November 15, 2010

The validation of the Columbia Analytical Services, Inc. (CAS, Kelso, Washington) laboratory data for the polychlorinated biphenyls and general chemistry analyses of the samples collected in 2010 to support the Phase 1 - RCRA Facility Investigation is complete as detailed below.

The analytical data were reviewed in accordance Barr's Data Validation SOPs which are based upon the U.S. EPA Contract Laboratory Program (CLP) National Functional Guidelines (NFG) for Organic Data Review (EPA 2005) and in general accordance with U.S. EPA Methods 160.3 modified and 8082 as specified in the Quality Assurance Project Plan (QAPP, Barr, March 2009).

In general, the areas covered by the validation process include:

- Overall assessment
- Holding times, preservation and storage
- Initial calibration and initial calibration verification
- Continuing calibration verification
- Blank analysis
- Deuterated monitoring compounds (Surrogates)
- Laboratory control samples
- Matrix spike results
- Field duplicate samples
- Field blank samples

The results for nine soil samples and one aqueous field blank sample are contained in this laboratory report. The samples are identified as follows:

FTS-21 (2-12)	FTS-22 (0-2)	FTS-23 (0-2)
FTS-24 (0-2)	FTS-25 (0-2)	FTS-26 (0-2)
FTS-27 (0-2)	FTS-28 (0-2)	FTS-121 (0-2) (Field Blank)
FTS-101 (0-2) (FTS-26 (0-2) DUP)		

The samples were analyzed for polychlorinated biphenyls (PCBs) and general chemistry parameters (total solids) as required using the methods detailed in the QAPP (Barr, March 2009).

Overall Assessment

The QAPP specified that 10% of the project data be reviewed using CLP NFG (Guidelines) and the remaining data be reviewed in accordance with Barr's Data Validation Standard Operating Procedures (SOPs). Because 90% of the data was correspondingly validated using non-CLP criteria, the laboratory criterion were used for consistency, except where outliers exceeded 30-150% EPA quality control criteria. In summary, because the Guidelines have limits which are often different than, and in certain cases are more stringent than, the limits specified by the analytical methods and the laboratory generated limits; the end result may be slightly different data qualification.

In accordance with the Guidelines, sample concentrations greater than the method detection limit and below the practical quantitation limit are "J" qualified for the PCB analyses. The data qualifiers indicate estimated concentrations for the analyses. The non-detect concentrations are presented as "<MDL" in the data tables.

The data are useable as reported and qualified and fulfill the data quality objectives (DQOs) for sensitivity, accuracy and precision as specified in the QAPP. The following sections provide specific validation details.

Holding Times, Preservation and Storage

The samples were collected on June 30th, 2010, packed on ice and sent to the laboratory (CAS, located in Kelso, Washington) with an accompanying chain-of-custody form (COC). Per the chain-of-custody and subsequent laboratory acknowledgement receipt forms, the samples were received intact with a temperature of -0.6 °C to 0.0 °C upon receipt at the laboratory. The samples were stored at 4 °C until analysis. No qualifiers were assigned due to holding times, preservation, or storage issues.

Initial Calibration and Initial Calibration Verification

The PCB initial calibrations (ICALs) and secondary source calibration verifications (SSCVs) met the established laboratory acceptance criterion.

Continuing Calibration Verification

The continuing calibration verification samples (CCVs) for the analysis of PCBs were analyzed at the appropriate frequency and yielded acceptable percent differences of less than 20% for Aroclors 1016 and 1260, indicating the analysis was in control.

Blank Analysis

As stated in Section B10.3.2 of the QAPP, when project sample concentrations are "<" (less than) five times the associated blank sample concentrations, thus suspected false positives, they are shown at the concentration reported in the sample, with a "<"qualifier analyses.

The method blank samples associated with the PCB analysis were prepared and analyzed as required. No PCBs were present above the MDL in the method blank samples. Instrument blank sample data were not provided by the laboratory as it is not a requirement of EPA Method 8082. While this is a deviation from the Guidelines, no PCB Aroclors were detected in the method blank samples and this procedure meets method criteria.

Deuterated Monitoring Compounds (DMC, Surrogates)

The laboratory acceptance criteria for the DMC percent recoveries for the PCB analysis in the project samples were met.

Laboratory Control Samples (Ongoing Precision/Accuracy)

Laboratory control samples (LCSs) were prepared and analyzed at the appropriate frequency for the target compounds and met the relevant acceptance criteria for percent recovery of the spike concentrations, indicating in-control analytical systems.

Matrix Spike Results

As standard practice, the laboratory reported a shortened list of PCB compounds for MS/MSD data. No qualification was performed based upon this occurrence.

Sample FTS-21 (2-12) served as the MS/MSD sample for the PCB analysis. The MS/MSD data met the applicable laboratory and EPA acceptance criteria for percent recovery and RPD.

General Chemistry Analysis (Total Solids)

No Guideline criteria exist for total solids analysis. The general chemistry data were reviewed in accordance with Barr's SOPs included in the QAPP. Results for total solids were accepted as reported. Sample FTS-21 (2-12) served as the analytical batch duplicate sample for the total solids analysis and the RPD data indicated that the laboratory and method criteria were met.

Field Duplicate Samples

Field duplicate samples were collected and analyzed in accordance with the frequency and parameters specified in the QAPP. Samples FTS-101 (0-2) (FTS-26 (0.2) DUP) served as the field duplicate sample for this data package. Field duplicate soil samples met the RPD criteria (40%) as specified in the QAPP.

Field Blank Samples

Field blank samples were collected and analyzed at the required frequency as specified in the QAPP. Sample FTS-121 (0-2) served as the field blank sample associated with this sample delivery group. The field blank sample was collected in the following manner: the sample equipment (i.e. stainless steel bowl, etc.) were rinsed with analyte-free, deionized water and the rinse water was poured into the appropriate sample containers for analysis. No target analytes were present above the MDL/PQL in the field blank sample associated with this data package.

Discussion

Several samples required dilution due to the presence of elevated levels of PCBs. The reporting limits were adjusted to reflect the dilution. This affected samples FTS-22 (0-2), FTS-24 (0-2), FTS-26 (0-2), FTS-28 (0-2) and FTS-101 (0-2) (FTS-26 (0-2) DUP).

Data Validation Report
Laboratory Report / Batch: K1007395

Rhodia Silver Bow Plant – Butte, Montana
2010 – Phase I RCRA Facility Investigation
U.S. EPA Corrective Action Order on Consent,
Docket No. RCRA-2006-08-2004-0001

Date of Data Validation Report: January 26, 2011

The validation of the Columbia Analytical Services, Inc. (CAS, Kelso, Washington) and ACZ Laboratories, Inc. (ACZ, Steamboat Springs, Colorado) laboratory data for the metals, general chemistry, and radiochemistry analyses of the samples collected in 2010 to support the Phase 1 - RCRA Facility Investigation is complete as detailed below.

The analytical data were reviewed in accordance Barr's Data Validation SOPs which are based upon the U.S. EPA Contract Laboratory Program (CLP) National Functional Guidelines (NFG) for Inorganic Data Review (EPA 2004) and in general accordance with U.S. EPA Methods 300.0, 350.1, 353.2, 365.2, 6010B, 6020, 7470A, 9310 modified, 9315 modified, 9320 and Standard Method 2320B as specified in the Quality Assurance Project Plan (QAPP, Barr, March 2009).

In general, the areas covered by the validation process include:

- Overall assessment
- Holding times, preservation and storage
- Instrument performance checks - ICP/MS Tuning
- Initial calibration and initial calibration verification
- Continuing calibration verification
- Blank analysis
- ICP/ICP/MS interference check samples (metals only)
- Laboratory control samples
- Internal standards
- Matrix spike results
- Field duplicate samples
- Field blank samples

The results for six groundwater samples and one aqueous field blank sample are contained in this laboratory report. The samples are identified as follows:

MW-06-1	MW-02-3	MW-06-2
MW-02-4	MW-82-3 (MW-02-3 DUP)	MW-60-12 (Field Blank)
MW-06-3		

The samples were analyzed for metals (ICP/ICP/MS/mercury), general chemistry parameters (chloride, fluoride, sulfate, ammonia, nitrate + nitrite, total phosphorus, bicarbonate and carbonate alkalinity) and radiochemistry parameters (gross alpha and beta and radium 228 and 228) as required using the methods detailed in the QAPP (Barr, March 2009).

Overall Assessment

The QAPP specified that 10% of the project data be reviewed using CLP NFG (Guidelines) and the remaining data be reviewed in accordance with Barr's Data Validation Standard Operating Procedures (SOPs). Because 90% of the data was correspondingly validated using non-CLP criteria, the laboratory criterion were used for consistency, except where outliers exceeded 30-150% EPA quality control criteria. In summary, because the Guidelines have limits which are often different than, and in certain cases are more stringent than, the limits specified by the analytical methods and the laboratory generated limits; therefore, the end result may be slightly different data qualification.

The data are useable as reported and qualified and fulfill the data quality objectives (DQOs) for sensitivity, accuracy and precision as specified in the QAPP. The following sections provide specific validation details.

Holding Times, Preservation and Storage

The samples were collected on July 16th through 18th, 2010, packed on ice and sent to the laboratories (CAS, located in Kelso, Washington and ACZ, located in Steamboat Springs, CO) with an accompanying chain-of-custody form (COC). Per the chain-of-custody and subsequent laboratory acknowledgement receipt forms, the samples were received intact with a temperature of -0.5 °C to 4.1 °C upon receipt at the laboratories. The samples were stored at 4 °C until analysis. No qualifiers were assigned due to holding times, preservation, or storage issues.

Instrument Performance Checks – ICP/MS Tuning (ICP/MS Metals)

Satisfactory instrument calibration is crucial to ensuring the accurate qualitative and quantitative results for the target compound of the analysis. Initial calibration procedures define the linear range and mean calibration factors that are used for sample quantitation.

The tuning aspects of the inductively coupled plasma mass spectrometer (ICP/MS) met the applicable acceptance criteria for mass resolution and the percent relative standard deviation (%RSD) for the five consecutive replicates at <5%.

Initial Calibration and Initial Calibration Verification

The ICP and ICP/MS initial calibrations were performed at the appropriate frequency and run order, and met minimum percent recovery (%R) acceptance criteria for each of the target metals. Mean concentrations from 2 replicate exposures were reported for ICP and from 3 replicate exposures for ICP/MS as required. Initial calibration verification (ICV) criterion of ±10% (of true value) for the target analytes was met during the initial calibration events.

The cold vapor mercury initial calibration events met the acceptance criterion of a correlation coefficient >0.995 using a minimum of at least four calibration standard solutions. The ICV criterion of 20% of the true value was also met for the cold vapor mercury analysis.

Continuing Calibration Verification

The continuing calibration verification samples (CCVs) for the ICP and ICP/MS analyses met data validation criteria for frequency, run order and acceptable percent recoveries were achieved within the analytes' method detection limit and the documented upper linear range of the instrument. Mean concentrations from the 2 (for ICP) and 3 (for ICPMS) replicate exposures were reported as required.

The CCVs associated with the cold vapor mercury analyses met the established acceptance criteria for frequency and the calculated percent recovery of 20% of the true value.

The Contract Required Quantitation Limit (CRQL) Check Standard (CRI) sample data for ICP, ICP/MS, and mercury did not met the data validation criteria for frequency, run order and/or percent recovery as dictated in the Guidelines. The CRI samples reported in the data packages were analyzed at the beginning of the analytical sequence(s). The percent recoveries for ICP, ICPMS and mercury met the percent recovery criterion established in the Guidelines with the following exceptions. The CRI percent recovery for calcium, iron and manganese by ICP did not meet the acceptance limits specified in the Guidelines in two CRI samples. Since Method 6010 does not require CRI analysis, no data were qualified.

Blank Analysis

As stated in Section B10.3.2 of the QAPP, when project sample concentrations are "<" (less than) five times the associated blank sample concentrations, thus suspected false positives, they are shown at the concentration reported in the sample, with a "<"qualifier analyses with the exception of the radiochemistry analyses detailed below.

The ICP, ICP/MS and mercury analyses method blank samples, initial calibration blank (ICB) and continuing calibration blank samples (CCBs) were prepared and analyzed at the appropriate frequency and met acceptance criteria for proper run order. The method blank, ICB and CCB samples showed no detectable target analytes above the laboratory reporting limit for the ICP, ICP/MS and mercury analyses.

ICP/ICP/MS Interference Check Samples (Metals Only)

The ICP and ICP/MS interference check samples (ICS) were analyzed at the appropriate frequency and in the correct order during the analysis of the project samples. Acceptable results of ± 20% of the true value were obtained for both solution A and solution AB.

Laboratory Control Samples (Ongoing Precision/Accuracy)

Laboratory control samples (LCSs) were prepared and analyzed at the appropriate frequency for the target compounds and met the relevant acceptance criteria for percent recovery of the spike concentrations, indicating in-control analytical systems.

The laboratory met the acceptance criteria for the ICP and ICPMS serial dilutions (≤ 10 %D), between the undiluted and diluted results, where sample results are significantly greater than the MDL (>50x). A post-digestion spike for ICP analyses was not performed. The ICP/MS and mercury serial dilutions and post-digestion spike percent recoveries met the applicable criteria.

Internal Standards (ICP/MS Analyses Only)

The ICP/MS internal standard data were acceptable. The ICP/MS internal standard data were acceptable. The internal standards displayed percent relative intensity (%RI) within the 60-125% range.

Matrix Spike Results

Sample MW-06-2 served as the MS sample for the ICP, ICP/MS, and mercury analyses. The MS data met the applicable laboratory and EPA acceptance criteria for percent recovery. The MS percent recovery for calcium, manganese and sodium for sample MW-06-2 were not applicable because the associated sample concentrations were greater than four times the spike concentration thereby preventing accurate evaluation of the spike recoveries.

General Chemistry Analysis (chloride, fluoride, sulfate, ammonia, nitrate + nitrite, total phosphorus, bicarbonate and carbonate alkalinity)

No Guideline criteria exist for the general chemistry analyses. The general chemistry data were reviewed in accordance with Barr's SOPs included in the QAPP. The ICV, CCV data indicated that the laboratory and method criteria were met for the various general chemistry analyses (listed above). Samples MW-06-2 served as the MS/MSD samples for the general chemistry analyses. The LCS and MS/MSD data indicated that the applicable laboratory and method criteria were met. Samples MW-06-2 and MW-82-3 served as the analytical batch duplicate samples for the general chemistry analyses. The analytical batch duplicate sample data indicated that the laboratory and method criteria were met for the general chemistry analyses. The method blank samples showed no detectable target analytes above the laboratory reporting limit for the general chemistry parameters. Trace concentrations of chloride and sulfate were present above the PQL in one or more of the CCB samples; however, no data were qualified because the CCB sample concentrations were too small to have an affect on the associated project samples.

Radiochemistry Analysis (Gross Alpha and Beta and Radium 226 and 228)

Results were reviewed in general accordance with the analytical methods specified in the QAPP. Samples MW-06-3, MW-02-4 and non-project specific samples served as the MS samples for one or more of the radiochemistry methods. Except for one case, the LCS and MS data met the applicable criterion for accuracy. The MS percent recovery for radium 228 was slightly below the laboratory acceptance criteria, since the deviation was minor (<1%) no data were qualified. Samples MW-06-2, and non-project specific samples served as the analytical batch duplicate samples for this data package. The replicate error ratios (RERs) met the laboratory acceptance limits for precision with the following exception: the laboratory duplicate RER for gross beta analysis was slightly (2.01 versus a

limit of 2) for sample MW-06-2. Since the deviation was minor, no gross beta data were qualified. The method blank samples had no detectable concentrations above the practical quantitation limit (i.e. lower limit of detection (LLD) for the target radiochemistry analytes.

Field Duplicate Samples

Field duplicate samples were collected and analyzed in accordance with the frequency and parameters specified in the QAPP. Samples MW-82-3 (MW-02-3 DUP) served as the field duplicate sample for this data package. Field duplicate soil samples met the RPD criteria (30%) as specified in the QAPP with the exception of radium 228. Sample concentrations near the practical quantitation limit/LLD can exaggerate the deviation of the RPD. Since the radium 228 sample concentrations were within five times the LLD, no qualification was deemed necessary.

Field Blank Samples

Field blank samples were collected and analyzed at the required frequency as specified in the QAPP. Sample MW-60-12 served as the field blank sample associated with this sample delivery group. The field blank sample was collected in the following manner: the sample equipment (i.e. pump, tubing and/or hoses) were rinsed with analyte-free, deionized water and the rinse water was poured into the appropriate sample containers for analysis. Field blank sampling procedures and protocols were determined to be appropriate and were collected and analyzed at the required frequency as specified in the QAPP. No target analytes were present above the practical quantitation limit in the field blank samples associated with this data package except where noted below. The field blank sample had detections of metals above the practical quantitation limit. The field blank sample results are presented in Appendix Q-4b. Associated sample concentrations within five times the associated field blank sample concentrations were reported with a "<" or U (EPA 2005 Organic and 2004 Inorganic Guidelines) qualifier. This affected lead, nickel and/or zinc for samples MW-06-3, MW-06-1, MW-02-3, MW-82-3, MW-06-2 and MW-02-4.

Data Validation Report
ALS Laboratory Report / Batch: 34-1020002

Rhodia Silver Bow Plant – Butte, Montana
2010 – Phase I RCRA Facility Investigation
U.S. EPA Corrective Action Order on Consent,
Docket No. RCRA-2006-08-2004-0001

Date of Data Validation Report: November 12, 2010

The data validation of the ALS Laboratory Group (ALS) laboratory data for the elemental (white) phosphorus of the 2010 – Phase I RCRA Facility Investigation Work Plan samples contained in the aforementioned report is complete as detailed below.

The analytical data were reviewed in general accordance with the quality control aspects contained in the U.S. EPA Method 7580 and/or ALS Laboratory Standard Operating Procedure as specified in the Quality Assurance Project Plan (QAPP, Barr, March 2009). In general, the areas covered by the validation process include:

- Overall assessment
- Holding times, preservation and storage
- Initial calibration and initial calibration verification
- Continuing calibration verification
- Method blank analysis
- Laboratory control samples
- Matrix spike results
- Field duplicate samples
- Field blank samples

The elemental phosphorus results for eight groundwater samples and one aqueous field blank sample are contained in this laboratory report. The samples are identified as follows:

MW-06-3	MW-06-1	MW-02-3
MW-82-3 (MW-02-3 DUP)	MW-06-2	MW-60-12 (Field Blank)
MW-02-4		

The groundwater and aqueous field blank samples were analyzed for elemental phosphorus using U.S.EPA method 7580 as specified in the QAPP (Barr, March 2009). During the data validation process, procedural deviations from the initial calibration procedures defined the U.S.EPA method were identified and are detailed below. While a deviation from the published procedures, this deviation is not considered to have a significant adverse affect on the final usability of the data; therefore, no qualification of the elemental phosphorus data was performed.

As required by the QAPP, elemental phosphorus concentrations were evaluated down to the laboratory's method detection limit (MDL). Any sample concentrations below the practical quantitation limit but above the method detection limit are qualified with a "J" indicating an estimated value. The non-detected concentrations are presented as "<MDL" in the data tables.

The data met the data quality objectives (DQOs) and are useable as reported and qualified.

Holding Times, Preservation and Storage

The U.S. EPA method 7580 defines the holding time as five calendar days from collection to extraction for water samples that are chilled to 4 ºC upon sample collection. Following extraction (iso-octane procedure) the method recommends a maximum holding time of 30 calendar days until analysis for both water and soil samples. The project samples were collected July 16th through July 18th, 2010, packed on ice and sent to the laboratory (ALS, Utah) with an accompanying chain-of-custody form (COC). Per the chain-of-custody and subsequent laboratory acknowledgement receipt forms, the samples were received intact with a temperature of 2 ºC to 4 ºC upon receipt at the laboratory and were stored at 4 ºC until analysis. Subsequent holding times for extraction and analysis were met. No qualifiers were assigned due to holding times, sample preservation or storage issues.

Initial Calibration and Initial Calibration Verification

Satisfactory instrument calibration is crucial to ensuring the accurate qualitative and quantitative results for the target compound of the analysis. Initial calibration procedures define the linear range and mean calibration factors that are used for sample quantitation.

Method 7580 requires an initial calibration (ICAL) to be performed every 12 hours and that it consist of (at a minimum) a 5-point calibration standard curve. Calibration factors (CFs) and associated standard deviation of those CFs are then calculated and must meet a relative standard deviation (RSD) of $\leq$ 15%. The laboratory SOP requires a minimum 6-point calibration standard (quadratic) curve and a coefficient of correlation of $\geq$ 0.99. The ICAL performed on July 8th, 2010 met the laboratory's initial calibration criterion.

Initial (opening) calibration verification standards (ICVs) are prepared and analyzed to ensure that the instrument is capable of producing acceptable qualitative and quantitative results at the beginning of the analytical process. The ICVs should be representative of the mid-point of the calibration curve. ICVs are required to be analyzed prior to the analysis of the method blank samples and project samples and must fall within ± 15% of the known value. The ICVs associated with the analyses of project samples met requirements for frequency and the ± 15% difference (% D) criterion (from the associated mid-level standard in the ICAL).

Upon review of the initial calibration data for the elemental phosphorus analyses, the following EPA method and laboratory SOP deviations are noted.

The laboratory created the new "working stock solutions" on January 1st, 2008 and 2009, April 16th, 2009, January 5th, 2010 and on July 8th, 2010. The ICAL was performed on July 8th, 2010 and the project samples were analyzed on July 22, 2010. This ICAL frequency exceeds the 12-hour requirement as defined in EPA Method 7580. While the published laboratory SOP does not specify a frequency of ICAL, it does indicate in Section 2.1 that, "no substantial modifications from the promulgated method have been made". Since the laboratory considers the working standards to be very stable under appropriate storage conditions, no elemental phosphorus data were qualified.

The laboratory used a flame-photometric detector (FPD) for elemental phosphorus analysis instead of the nitrogen-phosphorus detector (NPD) listed in Method 7580. According to the laboratory, the NPD cited in the Method had problems with long-term stability and the FPD did not have similar difficulty. Initial calibration verification standards (ICVs) and continuing calibration verification

standards (CCVs) were analyzed at the beginning and end of each analytical sequence and after every ten samples to demonstrate continued acceptable calibration. No elemental phosphorus data were qualified based upon the use of the alternate analytical detector.

Continuing Calibration Verification

Ongoing calibration verification standards (CCVs) are prepared and analyzed to ensure that the instrument is capable of producing acceptable qualitative and quantitative results throughout the analytical process. The CCVs should be representative of the mid-point of the calibration curve. CCVs are required to be analyzed every 10 samples and must fall within ± 15% of the known value. The CCVs associated with the analyses of project samples met requirements for frequency and the ± 15% D criterion (from the associated mid-level standard in the ICAL).

Method Blank Analysis

The purpose of the method or laboratory blank sample is to evaluate the existence and magnitude of contamination problems resulting from laboratory extraction and analytical activities. Method blank samples were prepared and analyzed with every batch of 20 project samples (or less). The method blank samples were prepared and analyzed at the appropriate frequency and were non-detect for elemental phosphorus.

Laboratory Control Samples (Ongoing Precision/Accuracy)

Laboratory control samples (LCSs) are prepared and analyzed to provide information on the accuracy of the analytical procedures and the overall laboratory performance. LCSs are prepared and analyzed with every batch of 20 project samples (or less). The percent recoveries of the spike concentration in the LCS samples are required to fall between 75-125%. The LCS samples were prepared and analyzed at the appropriate frequency and met the acceptance limits of 75-125% for the elemental phosphorus analyses associated with the data package.

Matrix Spike Results

The purpose of matrix spike (MS) and matrix spike duplicate (MSD) samples is to evaluate precision and accuracy of the methodology on specific sample matrices by demonstrating acceptable percent recovery of the known spike concentrations. Matrix spike (MS) and/or matrix spike duplicate (MSD) samples were prepared and analyzed at the appropriate frequency (every batch of ≤ 20 samples) during the analytical events. Sample MW-06-2 served as the MS/MSD sample associated with the elemental phosphorus analysis. The percent recoveries and associated RPD met the criteria of 75-125% and ≤ 15% RPD, respectively.

Field Duplicate Samples

Field duplicate samples were collected and analyzed to determine the precision of the combined sampling and analytical process. Precision was determined by calculating the RPD for the data pairs where both values were above the method detection limit. Sample MW-82-3 (MW-02-3 DUP served as the field duplicate sample for this event and was non-detect; therefore, the RPD was not calculated. All data was accepted as reported.

Field Blank Samples

The purpose of the collection and analysis of field (rinsate) blank sample is to monitor the contamination introduced from improper field equipment decontamination and sample transport procedures. The field blank sample (MW-60-12) was collected in the following manner: The sample equipment (i.e. tubing and/or hoses) was rinsed with analyte-free, deionized water and the rinse water was poured into the appropriate sample containers for analysis. One field blank sample (MW-60-12) was collected during the groundwater sampling event and was non-detect for elemental phosphorus.

Appendix 1-E1
2010 Overall Quality Control Assessment

1.1 Introduction and Executive Summary

The analytical data generated during the 2010 Phase 1 RCRA Facility Investigation (RFI), Rhodia Silver Bow Plant, Corrective Action Order on Consent, Docket No. RCRA-08-2004-0001 by Columbia Analytical Services, Inc. (CAS), ACZ Laboratories, Inc. (ACZ) and ALS Laboratory Group (ALS) were reviewed and validated in conformance with of the Quality Assurance Project Plan (QAPP, Barr, March 2009).

This Quality Control (QC) assessment is divided into two major sections following this introduction. Section 4.2 provides the QC assessment for the chemical analysis performed by the laboratories. Section 4.3 provides the QC assessment for the field sampling procedures.

The QC assessment of the soil and groundwater sample analytical data collected for the 2010 Phase 1 RFI, Rhodia Silver Bow Plant, demonstrate compliance with the data quality objectives in the QAPP. The analytical results have been validated and determined useable as qualified in the data summary tables and associated databases.

The QC assessment of the field sampling procedures and data demonstrate compliance with the data quality objectives in the QAPP and the Phase I RFI Workplan (Barr, 2009). The field sampling procedures were appropriate. No introduction of contamination or negative effects on sample representativeness was observed.

1.2 Laboratory Analyses

Columbia Analytical Services Inc. (CAS) located in Kelso, Washington conducted the physical preparation and chemical analyses of the analytical samples requiring polychlorinated biphenyls (PCBs), metals, and general chemistry analyses. ACZ Laboratories, Inc. (ACZ) located in Steamboat Springs, Colorado conducted the radiological analyses, and ALS Laboratory Group (ALS) located in Salt Lake City, Utah conducted the physical preparation and analysis of the analytical samples requiring elemental phosphorus analysis by modified EPA 7580 as set forth in the QAPP.

As set forth in Section B10.3.2 of the QAPP, 10% of the analytical data were validated in accordance with U.S. EPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic and Inorganic Data Review, (2005/2004) (Guidelines). Areas evaluated during the data validation process include holding times, initial and continuing instrument calibrations, surrogate and internal standard recoveries, laboratory control samples (LCS), matrix spike sample (MS) and matrix spike duplicate sample (MSD) data, laboratory duplicate sample data, laboratory method blank sample data and an overall assessment of the data. For the remaining data, the areas evaluated during the data validation process were focused to holding times, initial and continuing calibration summary data (where available), LCS, MS and MSD data, laboratory duplicate sample data, laboratory method blank sample data and an overall assessment of the data. In addition to the Guidelines, specific method criteria (SW-846) were also considered in the validation process as differences in some of the performance aspects exist between the Guidelines and the non-CLP methods used for the sample analysis. No Guidelines exist for the validation of radiological data, elemental phosphorus and general chemistry (chloride, fluoride, sulfate, ammonia, nitrate + nitrite, total phosphorus, bicarbonate and carbonate alkalinity,); therefore, a data quality review was performed to evaluate general conformity with the performance aspects of the individual analytical methods. As required by the United States Environmental Protection Agency (EPA), soil samples, results from the PCBs, metals, fluoride, and elemental phosphorus analyses were evaluated to the MDL. Where applicable, the PCBs, metals, fluoride, and elemental phosphorus data greater than the MDL and below the practical quantitation limit (PQL) are flagged with a "J" indicating an estimated concentration.

1.2.1 Laboratory Report Data Validation Summaries

Results from the analysis of soil and groundwater samples collected for the 2010 Phase 1 RCRA Facility Investigation, Rhodia Silver Bow Plant, Corrective Action Order on Consent, Docket No. RCRA-08-2004-0001 are included in the following laboratory reports:

Columbia Analytical Services, Inc. Data Packages		
K1006615	K1006636	K1006676
K1006777	K1006867	K1007395
ALS Laboratory Group Data Packages		
1020002		

* ACZ Laboratories, Inc. data is contained within Columbia Analytical Services, Inc. data packages.

The individual data evaluations for the laboratory reports listed above are provided in Appendix Q-2. This assessment provides an overview of the overall quality control aspects of the project data. The data validation reports contain more specific details regarding the application of sample qualifiers assigned during the validation process. The laboratory data are considered to be usable as qualified in the data summary tables and databases.

1.2.2 Overview of Quality Control Assessment

The Data Quality Objectives of 95% completeness were achieved (Section A9.2.3 of the QAPP).

The following is a general summary of the QC assessment of the analytical results of project samples performed by CAS, ACZ and ALS. Deviations in the quality control aspects discussed in detail below are limited to those QC issues considered to be significant. Individual data evaluations provide specific results of the validation and subsequent data qualification (provided in Appendix Q-2).

The project samples were analyzed for one or more of the following parameter(s)/groups: polychlorinated biphenyl (PCB) aroclors, metals, chloride, sulfate, ammonia, nitrate + nitrite, total phosphorus, bicarbonate and carbonate alkalinity, fluoride, percent solids, elemental (white) phosphorus and radiological compounds as described in Tables 1-1, 1-2, 1-3, 1-4, and 1-5 of the QAPP.

No deviations to the specified methodologies published in the QAPP occurred.

The laboratories met sample holding time requirements for extraction and analysis. Although there is no published holding time for fluoride soil analysis, the fluoride data for the soil samples contained within sample delivery groups K1006636 and K1006676 are “J” qualified due to the analysis being conducted approximately five months after the samples were collected. The fluoride data associated

with the soil samples in the two sample delivery groups should be considered estimated concentrations. This is detailed within the individual data evaluations located in Appendix Q-2.

With a few exceptions, the samples were received in acceptable condition and properly labeled. Labeling discrepancies were resolved prior to sample preparation and analysis. The samples were received at the laboratories within the acceptable sample temperatures (0 to 6 degrees C).

Instrument initial and continuing calibration data generally met the acceptance criteria. Exceptions include elemental phosphorus analysis. Specific details regarding initial and continuing calibration deviations are described in the individual data evaluation.

The laboratory control sample (LCS) analyses met the relevant acceptance criteria (Section A9.2.2 of the QAPP). Following the request from EPA (via QAPP comments), MS/MSD percent recoveries [1] <30% and >150% force results to be qualified "R" unusable. The LCS spike recoveries for the 2010 soil and groundwater samples were within the EPA recommendations.

Matrix spike (MS) and matrix spike duplicate (MSD) samples were submitted at the frequency specified in the QAPP. Most of the MS/MSD sample results met acceptance criteria for percent recovery and associated relative percent difference (RPD) for each of the required analyses/target compounds (PCBs, metals, chloride, sulfate, ammonia, nitrate + nitrite, total phosphorus, bicarbonate and carbonate alkalinity, fluoride, percent solids, elemental phosphorus and radiological compounds). In the few instances where deviations were observed in specific samples of these matrices, acceptable LCS and LCSD (accuracy and precision) results were achieved, indicating in-control analytical systems during sample analysis. Following the request from EPA (via QAPP comments), MS/MSD percent recoveries [2] <30% and >150% force results to be qualified "R" unusable. The MS spike recoveries for the 2010 soil and groundwater samples were within the EPA

---

[1] Percent recoveries include: laboratory control samples, matrix spike and matrix spike duplicates, surrogate standards, internal standards, interference check samples and initial and continuing calibration standards.

[2] Percent recoveries include: laboratory control samples, matrix spike and matrix spike duplicates, surrogate standards, internal standards, interference check samples and initial and continuing calibration standards.

recommendations. Minor deviations to the applicable MS/MSD laboratory criterion are discussed in detail in the individual data evaluations

Laboratory duplicate data met the relevant acceptance criteria (Section A9.2.1 of the QAPP) for precision with a few exceptions which are discussed in detail in the individual data evaluations. None of the deviations were considered significant or indicate systematic problems with the analytical processes performed.

Surrogate standards (for organic PCB analysis) met the acceptance criteria (Section A9.2.2.2 of the QAPP).

For the metals ICP analysis, interference check sample (ICS) acceptance criterion of +/-20% of the true value were met.

For the metals ICP and ICP/MS analysis, the contract required quantitation limit check standard solution (CRI) percent recoveries for chromium, iron, manganese, sodium did not meet the applicable Guideline criterion; however, no data were qualified because the CRI is not required in Method 6010 and Method 6020.

The majority of the ICP and ICPMS serial dilution data met the applicable criteria with three exceptions; the percent difference for magnesium in sample BG-9 (12-18) COMP; for beryllium and calcium in sample BG-16 (0-2) COMP; and for beryllium in sample BG-2 (2-12) COMP exceeded the laboratory acceptance limits and were qualified "J" estimated.

The ICPMS and mercury post-digestion spike data met the applicable criteria. A post-digestion spike for ICP analysis was not performed.

A minor deviation was made from the Guidelines relative to the affect of detected blank sample results on corresponding project sample results. In general, the Guidelines indicate that when sample concentrations are detected at or near the concentrations detected in the blank samples, the results should be presented as the CRQL/RL, with a corresponding "<" (less than) or U qualifier. However, the CRQLs are far greater than the final laboratory PQLs set forth in the QAPP. Therefore, when a project sample result is less than 5 times the associated blank sample concentration, the project sample result is reported with a "<" or U (EPA 2005 Organic Guidelines) qualifier.

Many target compounds were detected at very low concentrations in the laboratory method blank samples, no significant-gross-system-contamination issues were identified over the course of the analytical events. Samples impacted by blank sample concentrations have been qualified and are detailed in the individual data evaluations provided in Appendix Q-2.

1.3 Field Sampling

1.3.1 Field Sampling Quality Control

Field sampling procedures were performed in accordance with the Phase 1 RFI Work Plan (Barr, 2009).

Field quality control procedures included the collection and analysis of field duplicate samples and field blank samples to monitor the contamination introduced from improper field equipment decontamination, sample collection, sample transport, and laboratory analytical procedures. The results from the analysis of these samples demonstrate that the data are in compliance with the data quality objectives.

Sample identification techniques described in Sections A9 and B2 of the QAPP (Barr, March 2009) required the field (rinsate) blank samples be submitted to the laboratory as blind QC samples; therefore, the field blank samples were assigned a fictitious soil location name at the time of collection and their true identities were documented in the Field Logbook records. Field blank samples were collected in the following manner: The soil sampling equipment (i.e. stainless-steel bowl, and/or spoon, etc.) were rinsed with analyte-free, deionized water. The rinse water was poured into the appropriate sample containers for analysis. The data is presented in the data summary tables using the soil sample locations they were collected from along with the fictitious sample locations identified on the chain-of-custody forms.

Field sampling procedures and protocols were determined to be appropriate. As described in the QAPP, blank samples associated with the soil sampling were analyzed for corresponding sample analysis (PCBs, metals, chloride, sulfate, ammonia, nitrate + nitrite, total phosphorus, bicarbonate and carbonate alkalinity, fluoride, percent solids, elemental phosphorus and radiological compounds). Although several field blank samples had low levels of target analytes present below or near the MDL/PQL, no introduction of gross contamination or other adverse affects on sample representativeness were identified. The field blank sample results are summarized Appendix Q-4b and are detailed within the individual data evaluations in Appendix Q-2.

A total of four field duplicate samples were collected as specified in Section A9.3.2 of the QAPP. Precision (both field and analytical) was evaluated through a comparison of the duplicate data when both the native and duplicate sample had detected concentrations reported.

The precision was evaluated by calculating the relative percent difference (RPD) for the data pairs as follows:

$$RPD = \frac{D_1 - D_2}{(D_1 + D_2)/2} \times 100$$

Where: D_1 = concentration of sample
D_2 = concentration of duplicate sample

The RPD results for arsenic, cadmium, mercury, sodium, lead 210, radium 228, thorium 230, and uranium 234, 235 and 238 fell beyond the 40% criteria in one or more of the field duplicate pairs. However, RPD results are dependent on the heterogeneity of the samples. Higher RPDs are expected when results are at or near the PQL and do not always indicate poor precision. Data qualifiers were applied due RPD exceedences in only one case, and the data are qualified accordingly in the data summary tables. The field duplicate sample results are discussed in detail within the individual data evaluations.

July 30, 2010 Analytical Report for Service Request No: K1006615

Andrea Nord
Barr Engineering
4700 West 77th Street
Minneapolis, MN 55435

RE: Rhodia Silver Bow Plant background/26-46-0006.13-2010-400

Dear Andrea:

Enclosed are the results of the samples submitted to our laboratory on June 25, 2010. For your reference, these analyses have been assigned our service request number K1006615.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.caslab.com. All results are intended to be considered in their entirety, and Columbia Analytical Services, Inc. (CAS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please call if you have any questions. My extension is 3358. You may also contact me via Email at LHuckestein@caslab.com.

Respectfully submitted,

Columbia Analytical Services, Inc.

Lynda Huckestein
Client Services Manager

GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value that was detected outside the quantitation range.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.1 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
J	The result is an estimated value that was detected outside the quantitation range.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.1 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.
Q	See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value that was detected outside the quantitation range.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.1 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Case Narrative

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Barr Engineering Company	**Service Request No.:**	K1006615
Project:	Rhodia Silver Bow Plant Background	**Date Received:**	6/25/2010
Sample Matrix:	Soil		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier III validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Nine soil samples were received for analysis at Columbia Analytical Services on 6/25/2010. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

Fluoride by EPA Method 340.2 Modified:
The matrix spike recovery of Fluoride for sample BG-9-12-18 COMP was within control criteria. A matrix spike duplicate was also analyzed, but produced results outside of control limits. The results of the original analysis were reported. No further corrective action was appropriate.

Total Metals

Matrix Spike Recovery Exceptions:
The control criteria for matrix spike recovery of Iron for sample BG-9-12-18 COMP were not applicable. The analyzed concentration in the sample was significantly higher than the added spike concentration, preventing accurate evaluation of the spike recovery.

Radiochemistry

The analyses for the Radiochemistry parameters were performed at ACZ Laboratories in Steamboat Springs, Colorado. The results from this testing are included in their entirety herein.

DATA QUALITY REPORT
INORGANICS

Explain any "no" responses to questions below, and any corrective actions in the comments section below.

1.	Is the method name and number correct and appropriate?		yes/no/NA
2.	Holding times met for all analyses and for all samples?		yes/no/NA
3.	Are calculations correct?		yes/no/NA
4.	Is the reporting basis correct? (Dry Weight)		yes/no/NA
5.	All quality control criteria met?		yes/no/NA
	a.	Is the calibration curve correlation coefficient ≥ 0.995?	yes/no/NA
	b.	MBs, CCVs, CCBs, LCSs, Dups, and Spikes, analyzed at proper frequency?	yes/no/NA
	c.	Are ICVs, CCVs, and CCBs all within acceptance limits?	yes/no/NA
	d.	Are results for methods blanks all ND?	yes/no/NA
	e.	Are all QC samples within acceptance criteria? (LCS % rec, MS/DMS % rec, DUP or MS/DMS RPDs, etc.)	yes/no/NA
	f.	Are all exceptions explained?	yes/no/NA
6.	Are all service requests that apply attached?		yes/no/NA
7.	Are all samples labelled correctly?		yes/no/NA
8.	Have all instructions on the service request been followed? (e.g. Special MRLs, QC on a specific sample)		yes/no/NA
9.	Are detection limits and units reported correctly?		yes/no/NA
10.	Are proper Analysis/Extraction stickers included on report?		yes/no/NA
11.	Is the unused space on the benchsheet crossed out?		yes/no/NA
12.	Was analysis turned in by the due date? (n-2) (If not record SR#)		yes/no/NA

COMMENTS:

5e) K6777-5ms/5msd failed Suspect matrix interference. K6015 msd failed by 1% RPD between spk + spk dup. Reanalysis

Final Approved by: [signature] Date: 7/28/10

ICP-OES Data Review Form

	Yes	No
1. Standardization completed	✓	
2. ICV within 10 % of true value	✓	
3. ICB below MRL	✓	
4. CRI standard analyzed.	✓	
5. ICS standards within 20% of true value	✓	
6. All preceding CCVs within 10 % of true value	✓	
7. Following CCV within 10 % of true value	✓	
8. Bracketing CCBs below MRL	✓	
9. Method Blank below MRL	✓	
10. MS-MSD or Dup-MS and LCS within CAS control limits	✓	
11. All analytes within instrument linear range	✓	
12. Adequate rinse out time allowed between samples to eliminate memory effect	✓

Project ID: K1006615
ACZ Project ID: L82975

Lynda Huckestein:

Enclosed are the analytical results for sample(s) submitted to ACZ Laboratories, Inc. (ACZ) on June 29, 2010. This project has been assigned to ACZ's project number, L82975. Please reference this number in all future inquiries.

All analyses were performed according to ACZ's Quality Assurance Plan. The enclosed results relate only to the samples received under L82975. Each section of this report has been reviewed and approved by the appropriate Laboratory Supervisor, or a qualified substitute.

Except as noted, the test results for the methods and parameters listed on ACZ's current NELAC certificate letter (#ACZ) meet all requirements of NELAC.

This report shall be used or copied only in its entirety. ACZ is not responsible for the consequences arising from the use of a partial report.

All samples and sub-samples associated with this project will be disposed of after August 28, 2010. If the samples are determined to be hazardous, additional charges apply for disposal (typically less than $10/sample). If you would like the samples to be held longer than ACZ's stated policy or to be returned, please contact your Project Manager or Customer Service Representative for further details and associated costs. ACZ retains analytical reports for five years.

If you have any questions or other needs, please contact your Project Manager.

Sue Webber has reviewed and approved this report.

Report Header Explanations

Batch	A distinct set of samples analyzed at a specific time
Found	Value of the QC Type of interest
Limit	Upper limit for RPD, in %.
Lower	Lower Recovery Limit, in % (except for LCSS, mg/Kg)
MDL	Method Detection Limit. Same as Minimum Reporting Limit. Allows for instrument and annual fluctuations.
PCN/SCN	A number assigned to reagents/standards to trace to the manufacturer's certificate of analysis
PQL	Practical Quantitation Limit, typically 5 times the MDL.
QC	True Value of the Control Sample or the amount added to the Spike
Rec	Amount of the true value or spike added recovered, in % (except for LCSS, mg/Kg)
RPD	Relative Percent Difference, calculation used for Duplicate QC Types
Upper	Upper Recovery Limit, in % (except for LCSS, mg/Kg)
Sample	Value of the Sample of interest

QC Sample Types

AS	Analytical Spike (Post Digestion)	LCSWD	Laboratory Control Sample - Water Duplicate
ASD	Analytical Spike (Post Digestion) Duplicate	LFB	Laboratory Fortified Blank
CCB	Continuing Calibration Blank	LFM	Laboratory Fortified Matrix
CCV	Continuing Calibration Verification standard	LFMD	Laboratory Fortified Matrix Duplicate
DUP	Sample Duplicate	LRB	Laboratory Reagent Blank
ICB	Initial Calibration Blank	MS	Matrix Spike
ICV	Initial Calibration Verification standard	MSD	Matrix Spike Duplicate
ICSAB	Inter-element Correction Standard - A plus B solutions	PBS	Prep Blank - Soil
LCSS	Laboratory Control Sample - Soil	PBW	Prep Blank - Water
LCSSD	Laboratory Control Sample - Soil Duplicate	PQV	Practical Quantitation Verification standard
LCSW	Laboratory Control Sample - Water	SDL	Serial Dilution

QC Sample Type Explanations

Blanks	Verifies that there is no or minimal contamination in the prep method or calibration procedure.
Control Samples	Verifies the accuracy of the method, including the prep procedure.
Duplicates	Verifies the precision of the instrument and/or method.
Spikes/Fortified Matrix	Determines sample matrix interferences, if any.
Standard	Verifies the validity of the calibration.

ACZ Qualifiers (Qual)

B	Analyte concentration detected at a value between MDL and PQL. The associated value is an estimated quantity.
H	Analysis exceeded method hold time. pH is a field test with an immediate hold time.
U	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.

Comments

(1)	QC results calculated from raw data. Results may vary slightly if the rounded values are used in the calculations.
(2)	Soil, Sludge, and Plant matrices for Inorganic analyses are reported on a dry weight basis.
(3)	Animal matrices for Inorganic analyses are reported on an "as received" basis.
(4)	An asterisk in the "XQ" column indicates there is an extended qualifier and/or certification qualifier associated with the result.

Report Header Explanations

Batch	A distinct set of samples analyzed at a specific time
Error(+/-)	Calculated sample specific uncertainty
Found	Value of the QC Type of interest
Limit	Upper limit for RPD, in %.
LCL	Lower Control Limit, in % (except for LCSS, mg/Kg)
LLD	Calculated sample specific Lower Limit of Detection
PCN/SCN	A number assigned to reagents/standards to trace to the manufacturer's certificate of analysis
PQL	Practical Quantitation Limit
QC	True Value of the Control Sample or the amount added to the Spike
Rec	Amount of the true value or spike added recovered, in % (except for LCSS, mg/Kg)
RER	Relative Error Ratio, calculation used for Dup. QC taking into account the error factor.
UCL	Upper Control Limit, in % (except for LCSS, mg/Kg)
Sample	Value of the Sample of interest

QC Sample Types

DUP	Sample Duplicate	MS/MSD	Matrix Spike/Matrix Spike Duplicate
LCSS	Laboratory Control Sample - Soil	PBS	Prep Blank - Soil
LCSW	Laboratory Control Sample - Water	PBW	Prep Blank - Water

QC Sample Type Explanations

Blanks	Verifies that there is no or minimal contamination in the prep method procedure.
Control Samples	Verifies the accuracy of the method, including the prep procedure.
Duplicates	Verifies the precision of the instrument and/or method.
Matrix Spikes	Determines sample matrix interferences, if any.

ACZ Qualifiers (Qual)

H	Analysis exceeded method hold time.
R	Poor spike recovery accepted because the other spike in the set fell within the given limits.
T	High Replicate Error Ratio (RER) accepted because sample concentrations are less than 10x the MDL.
U	No nuclides detected above the Lower Limit of Detection (LLD)
V	High blank data accepted because sample concentration is 10 times higher than blank concentration
X	QC is out of control. See Case Narrative.
Z	Poor spike recovery is accepted because sample concentration is four times greater than spike concentration.

Method Prefix Reference

M	EPA methodology, including those under SDWA, CWA, and RCRA
SM	Standard Methods for the Examination of Water and Wastewater, 19th edition (1995) & 20th edition (1998).
D	ASTM
RP	DOE
ESM	DOE/ESM

Comments

(1) Solid matrices are reported on a dry weight basis.

(2) Preparation method: "Method" indicates preparation defined in analytical method.

(3) QC results calculated from raw data. Results may vary slightly if the rounded values are used in the calculations.

(4) An asterisk in the "XQ" column indicates there is an extended qualifier and/or certification qualifier associated with the result.

For a complete list of ACZ's Extended Qualifiers, please click: http://www.acz.com/public/extquallist.pdf

RadChem Extended Qualifier Report

Columbia Analytical Services

ACZ Project ID: ***L82975***

ACZ ID	WORKNUM	PARAMETER	METHOD	QUAL	DESCRIPTION

No extended qualifiers associated with this analysis

Radiochemistry

The following parameters are not offered for certification or are not covered by NELAC certificate #ACZ.

Lead 210 (3050)	Eichrom
Thorium 230 (3050)	ESM 4506
Uranium 234	Eichrom
Uranium 235	Eichrom
Uranium 238	Eichrom

ACZ Laboratories, Inc.
2773 Downhill Drive Steamboat Springs, CO 80487 (800) 334-5493

Sample Receipt

Columbia Analytical Services
K1006615

ACZ Project ID: L82975
Date Received: 06/29/2010 10:31
Received By: gac
Date Printed: 6/30/2010

Receipt Verification

	YES	NO	NA
1) Does this project require special handling procedures such as CLP protocol?			X
2) Are the custody seals on the cooler intact?	X		
3) Are the custody seals on the sample containers intact?			X
4) Is there a Chain of Custody or other directive shipping papers present?	X		
5) Is the Chain of Custody complete?	X		
6) Is the Chain of Custody in agreement with the samples received?	X		
7) Is there enough sample for all requested analyses?	X		
8) Are all samples within holding times for requested analyses?	X		
9) Were all sample containers received intact?	X		
10) Are the temperature blanks present?			X
11) Are the trip blanks (VOA and/or Cyanide) present?			X
12) Are samples requiring no headspace, headspace free?			X
13) Do the samples that require a Foreign Soils Permit have one?			X

Exceptions: If you answered no to any of the above questions, please describe

Analysis Date: 7-12-10

Sample type used: AS-REC, SOIL

Extraction / Digestion / Analysis / Prep / Calc:

	Yes	No	N/A
1. Is the raw data checked to the computer printout for transcription errors?	✓		
2. Is the %solid or TS attached for dilution factors?			✓
3. Were proper volumes of reagents used per final volume?			✓
4. Was the proper sub-sample used (as received, <2000, <500, <250, dry)?	✓		
5.Were the dilution factor calculation checked (final volume, weight, %solid)?			✓
6. Did the RPD pass?			✓
7. Does all the spike information correlate with each other?			✓
8. Is the appropriate spike in the computer-designated line?			✓
9. Are all errors properly corrected (single-line crossout, dated & initialed)?	✓		
10. Is the standard/reagent information complete and current?			✓
FOR SREV: QA/QC approval for initial training or 2 sets of initials for WG & LIMS?	✓

Analysis Date: 7/15/2010

Sample type used: <2000

Extraction / Digestion / Analysis / Prep / Calc: 3050

	Yes	No	N/A
1. Is the raw data checked to the computer printout for transcription errors?	✓		
2. Is the %solid or TS attached for dilution factors?	✓		
3. Were proper volumes of reagents used per final volume?	✓		
4. Was the proper sub-sample used (as received, <2000, <500, <250, dry)?	✓		
5.Were the dilution factor calculation checked (final volume, weight, %solid)?	✓		
6. Did the RPD pass?			✓
7. Does all the spike information correlate with each other?			✓
8. Is the appropriate spike in the computer-designated line?			✓
9. Are all errors properly corrected (single-line crossout, dated & initialed)?	✓		
10. Is the standard/reagent information complete and current?	✓		
FOR SREV: QA/QC approval for initial training or 2 sets of initials for WG & LIMS?

Analysis Date: 7/14/2010

Sample type used: DRY

Extraction / Digestion / Analysis / ~~Prep~~ Calc: SP- CP

	Yes	No	N/A
1. Is the raw data checked to the computer printout for transcription errors?	✓		
2. Is the %solid or TS attached for dilution factors?			✓
3. Were proper volumes of reagents used per final volume?			✓
4. Was the proper sub-sample used (as received, <2000, <500, <250, (dry))?	✓		
5. Were the dilution factor calculation checked (final volume, weight, %solid)?			✓
6. Did the RPD pass? BRD 7/16/10	✓		✓
7. Does all the spike information correlate with each other?			✓
8. Is the appropriate spike in the computer-designated line?			✓
9. Are all errors properly corrected (single-line crossout, dated & initialed)?	✓		
10. Is the standard/reagent information complete and current?	✓		
FOR SREV: QA/QC approval for initial training or 2 sets of initials for WG & LIMS?	✓

Radiochemistry Data Review Checklist

Data Reviewer: MWM
Date: 7-26-10

Approved: MWB
Date: 7-26-10

Work Group: WG286455
Sample Type: Soil
Analysis Date: 7-20-10
Analyst: TCD
Prep Date: 7-19-10

Weekly background file: Back612
Daily background file: Back614

Alpha performance file: Perf412
Beta performance file: —

GAB dry date/time: —

	Yes	No	NA
1) **FOR SREV**: QA/QC approval for initial training or 2 sets of initials for WG & LIMS?	✓		
2) Does the workgroup include all required QC samples?	✓✓		
3) Are all QC criteria listed in LIMS within specified limits?	✓✓		
4) Does all QC have the correct nomenclature (PBS vs PBW, etc.)?	✓✓		
5) For GABs: Beta LCS/MS deleted from Alpha & Alpha LCS/MS deleted from Beta?			✓✓
6) Are all PCNs / SCNs used for LIMS calculations entered correctly?	✓✓		
7) Have all transcriptions been reviewed for accuracy (e.g. volumes, BG's, sx counts, etc.)?	✓✓		
8) Are samples flagged for INSX, if applicable?			✓✓
9) Is any sample analyzed using less volume appropriately "D" qualified?			✓✓
10) Are all calculations based on the correct matrix?	✓✓		
11) Are all errors properly corrected (i.e. single-line crossout, dated & initialed)?	✓✓		
12) Is a current standard/reagent sheet attached to the workgroup?	✓✓		
13) Are all associated WG benchsheets locked for editing?	✓✓		
14) For GAB WG's containing DW samples, did at least 72 hours elapse between end of drying and start of counting?			✓✓

LCS & MS rc100624-2

Reagents

Barium Carrier:	rc100204-1	EDTA	rc100712-1
Sulfuric Acid	34642	Sulfuric Acid 0.1N	34642
Nitric Acid	35035	Ammonium sulfate	rc100616-1
lead carrier	rc100713-1	Acetic Acid	34657
Sodium hydroxide 10 N		Citric acid	rc100511-1

COMMENTS:

Beta performance file: —

GAB dry date/time: —

	Yes	No	NA
1) FOR SREV: QA/QC approval for initial training or 2 sets of initials for WG & LIMS?			
2) Does the workgroup include all required QC samples?	✓		
3) Are all QC criteria listed in LIMS within specified limits?	✓		
4) Does all QC have the correct nomenclature (PBS vs PBW, etc.)?	✓		
5) For GABs: Beta LCS/MS deleted from Alpha & Alpha LCS/MS deleted from Beta?			✓
6) Are all PCNs / SCNs used for LIMS calculations entered correctly?	✓		
7) Have all transcriptions been reviewed for accuracy (e.g. volumes, BG's, sx counts, etc.)?	✓		
8) Are samples flagged for INSX, if applicable?			✓
9) Is any sample analyzed using less volume appropriately "D" qualified?			✓
10) Are all calculations based on the correct matrix?	✓		
11) Are all errors properly corrected (i.e. single-line crossout, dated & initialed)?	✓		
12) Is a current standard/reagent sheet attached to the workgroup?	✓		
13) Are all associated WG benchsheets locked for editing?	✓		
14) For GAB WG's containing DW samples, did at least 72 hours elapse between end of drying and start of counting?			✓

GAB dry date/time: —

	Yes	No	NA
1) **FOR SREV:** QA/QC approval for initial training or 2 sets of initials for WG & LIMS?	✓		
2) Does the workgroup include all required QC samples?	✓		
3) Are all QC criteria listed in LIMS within specified limits?	✓		
4) Does all QC have the correct nomenclature (PBS vs PBW, etc.)?	✓		
5) For GABs: Beta LCS/MS deleted from Alpha & Alpha LCS/MS deleted from Beta?			✓
6) Are all PCNs / SCNs used for LIMS calculations entered correctly?	✓		
7) Have all transcriptions been reviewed for accuracy (e.g. volumes, BG's, sx counts, etc.)?	✓		
8) Are samples flagged for INSX, if applicable?			✓
9) Is any sample analyzed using less volume appropriately "D" qualified?			✓
10) Are all calculations based on the correct matrix?	✓		
11) Are all errors properly corrected (i.e. single-line crossout, dated & initialed)?	✓		
12) Is a current standard/reagent sheet attached to the workgroup?	✓		
13) Are all associated WG benchsheets locked for editing?	✓		
14) For GAB WG's containing DW samples, did at least 72 hours elapse between end of drying and start of counting?			✓

GAB dry date/time: —

	Yes	No	NA
1) **FOR SREV:** QA/QC approval for initial training or 2 sets of initials for WG & LIMS?	✓		
2) Does the workgroup include all required QC samples?	✓		
3) Are all QC criteria listed in LIMS within specified limits?	✓		
4) Does all QC have the correct nomenclature (PBS vs PBW, etc.)?	✓		
5) For GABs: Beta LCS/MS deleted from Alpha & Alpha LCS/MS deleted from Beta?			✓
6) Are all PCNs / SCNs used for LIMS calculations entered correctly?	✓		
7) Have all transcriptions been reviewed for accuracy (e.g. volumes, BG's, sx counts, etc.)?	✓		
8) Are samples flagged for INSX, if applicable?			✓
9) Is any sample analyzed using less volume appropriately "D" qualified?			✓
10) Are all calculations based on the correct matrix?	✓		
11) Are all errors properly corrected (i.e. single-line crossout, dated & initialed)?	✓		
12) Is a current standard/reagent sheet attached to the workgroup?	✓		
13) Are all associated WG benchsheets locked for editing?	✓		
14) For GAB WG's containing DW samples, did at least 72 hours elapse between end of drying and start of counting?			✓

July 30, 2010 Analytical Report for Service Request No: K1006636

Andrea Nord
Barr Engineering
4700 West 77th Street
Minneapolis, MN 55435

RE: Rhodia Silver Bow Plant Background/26-46-0006.13-2010-400

Dear Andrea:

Enclosed are the results of the samples submitted to our laboratory on June 26, 2010. For your reference, these analyses have been assigned our service request number K1006636.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.caslab.com. All results are intended to be considered in their entirety, and Columbia Analytical Services, Inc. (CAS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please call if you have any questions. My extension is 3358. You may also contact me via Email at LHuckestein@caslab.com.

Respectfully submitted,

Columbia Analytical Services, Inc.

Lynda Huckestein
Client Services Manager

CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value that was detected outside the quantitation range.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.1 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
J	The result is an estimated value that was detected outside the quantitation range.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.1 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.
Q	See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value that was detected outside the quantitation range.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.1 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Case Narrative

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Barr Engineering Company	**Service Request No.:**	K1006636
Project:	Rhodia Silver Bow Plant Background	**Date Received:**	6/26/2010
Sample Matrix:	Soil, Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier III validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Eight samples were received for analysis at Columbia Analytical Services on 6/26/2010. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

Fluoride by EPA Method 340.2 Modified:
The matrix spike recovery of Fluoride for sample BG-10 0-2 COMP was outside control criteria because of suspected matrix interference. A matrix spike duplicate was also analyzed, but produced similar results. The results of the original analysis were reported. No further corrective action was appropriate.

Total Metals – Soil

Matrix Spike Recovery Exceptions:
The control criteria for matrix spike recovery of Iron for the Batch QC sample were not applicable. The analyte concentration in the sample was significantly higher than the added spike concentration, preventing accurate evaluation of the spike recovery.

Relative Percent Difference Exceptions:
The Relative Percent Difference (RPD) for the replicate analysis of Uranium in the Batch QC sample was outside the normal CAS control limits. The variability in the results was attributed to the heterogeneous character of the sample. Standard mixing techniques were used, but were not sufficient for complete homogenization of this sample.

Total Metals – Water

Matrix Spike Recovery Exceptions:
The control criteria for matrix spike recovery of Iron for the Batch QC sample were not applicable. The analyte concentration in the sample was significantly higher than the added spike concentration, preventing accurate evaluation of the spike recovery.

Radiochemistry

The analyses for the Radiochemistry parameters were performed at ACZ Laboratories in Steamboat Springs, Colorado. The results from this testing are included in their entirety herein.

DATA QUALITY REPORT
INORGANICS

Explain any "no" responses to questions below, and any corrective actions in the comments section below.

1.	Is the method name and number correct and appropriate?		yes/no/NA
2.	Holding times met for all analyses and for all samples?		yes/no/NA
3.	Are calculations correct?		yes/no/NA
4.	Is the reporting basis correct? (Dry Weight)		yes/no/NA
5.	All quality control criteria met?		yes/no/NA
	a.	Is the calibration curve correlation coefficient ≥ 0.995?	yes/no/NA
	b.	MBs, CCVs, CCBs, LCSs, Dups, and Spikes, analyzed at proper frequency?	yes/no/NA
	c.	Are ICVs, CCVs, and CCBs all within acceptance limits?	yes/no/NA
	d.	Are results for methods blanks all ND?	yes/no/NA
	e.	Are all QC samples within acceptance criteria? (LCS % rec, MS/DMS % rec, DUP or MS/DMS RPDs, etc.)	yes/no/NA
	f.	Are all exceptions explained?	yes/no/NA
6.	Are all service requests that apply attached?		yes/no/NA
7.	Are all samples labelled correctly?		yes/no/NA
8.	Have all instructions on the service request been followed? (e.g. Special MRLs, QC on a specific sample)		yes/no/NA
9.	Are detection limits and units reported correctly?		yes/no/NA
10.	Are proper Analysis/Extraction stickers included on report?		yes/no/NA
11.	Is the unused space on the benchsheet crossed out?		yes/no/NA
12.	Was analysis turned in by the due date? (n-2) (If not record SR#)		yes/no/NA

COMMENTS:

K0636 - Initial failed - Suspect matrix interference

Final Approved by: _____ Date: 7/2/10

All Samples	acqmet11	7:45:18 7/28/10

Instrument Setup - Configurations

Configuration Name - acqmet11
Description - PQExcell CCT Sim Default
Date - 7:45:18 7/28/10
Maximum Uptake Time - 0
Maximum Washout Time - 0
S-Option Pump Running - No
Plasma Screen Forward - No
Makeup Gas On - No
Use CCT - No
Use Accessory Gas - No

Setting	Value
Extraction	-500.00
Lens1	5.00
Lens2	-50.00
Lens3	-25.00
Pole Bias	5.00
Sampling Depth	400.00
Horizontal	5.00
Vertical	75.00
Cool	13.00
Auxiliary	0.80
Nebuliser	0.82
Forward power	1,360.00
HT1 Voltage	1,900.00
HT2 Voltage	2,600.00
D1	-36.00
Focus	12.00

ICP INTERELEMENT CORRECTION FACTORS

Client: Barr Engineering Company Service Request: K1006636

Project No.: 26-46-0006.13-2010-400

Project Name: Rhodia Silver Bow Plant Backgrou

ICP ID Number: K-ICP-AES-02

Analyte	Wave-length (nm)	Interelement Correction Factors for:				
Aluminum	308.215					
Antimony	206.838					
Arsenic	189.042					
Barium	493.409					
Beryllium	313.042					
Boron	249.678					
Cadmium	228.802					
Calcium	211.2					
Chromium	267.716					
Cobalt	228.616					
Copper	324.754					
Iron	271.4					
Lead	220.353					
Magnesium	202.5					
Manganese	293.9					
Molybdenum	202.03					
Nickel	231.604					
Phosphorus	214.9					
Potassium	766.491					
Selenium	196.026					
Silicon	228.158					
Silver	328.068					
Sodium	588.995					
Strontium	421.552					
Thallium	190.864

Project ID: K1006636
ACZ Project ID: L82973

Lynda Huckestein:

Enclosed are the analytical results for sample(s) submitted to ACZ Laboratories, Inc. (ACZ) on June 29, 2010. This project has been assigned to ACZ's project number, L82973. Please reference this number in all future inquiries.

All analyses were performed according to ACZ's Quality Assurance Plan. The enclosed results relate only to the samples received under L82973. Each section of this report has been reviewed and approved by the appropriate Laboratory Supervisor, or a qualified substitute.

Except as noted, the test results for the methods and parameters listed on ACZ's current NELAC certificate letter (#ACZ) meet all requirements of NELAC.

This report shall be used or copied only in its entirety. ACZ is not responsible for the consequences arising from the use of a partial report.

All samples and sub-samples associated with this project will be disposed of after August 21, 2010. If the samples are determined to be hazardous, additional charges apply for disposal (typically less than $10/sample). If you would like the samples to be held longer than ACZ's stated policy or to be returned, please contact your Project Manager or Customer Service Representative for further details and associated costs. ACZ retains analytical reports for five years.

If you have any questions or other needs, please contact your Project Manager.

Sue Webber has reviewed and approved this report.

Report Header Explanations

Batch	A distinct set of samples analyzed at a specific time
Error(+/-)	Calculated sample specific uncertainty
Found	Value of the QC Type of interest
Limit	Upper limit for RPD, in %.
LCL	Lower Control Limit, in % (except for LCSS, mg/Kg)
LLD	Calculated sample specific Lower Limit of Detection
PCN/SCN	A number assigned to reagents/standards to trace to the manufacturer's certificate of analysis
PQL	Practical Quantitation Limit
QC	True Value of the Control Sample or the amount added to the Spike
Rec	Amount of the true value or spike added recovered, in % (except for LCSS, mg/Kg)
RER	Relative Error Ratio, calculation used for Dup. QC taking into account the error factor.
UCL	Upper Control Limit, in % (except for LCSS, mg/Kg)
Sample	Value of the Sample of interest

QC Sample Types

DUP	Sample Duplicate	MS/MSD	Matrix Spike/Matrix Spike Duplicate
LCSS	Laboratory Control Sample - Soil	PBS	Prep Blank - Soil
LCSW	Laboratory Control Sample - Water	PBW	Prep Blank - Water

QC Sample Type Explanations

Blanks	Verifies that there is no or minimal contamination in the prep method procedure.
Control Samples	Verifies the accuracy of the method, including the prep procedure.
Duplicates	Verifies the precision of the instrument and/or method.
Matrix Spikes	Determines sample matrix interferences, if any.

ACZ Qualifiers (Qual)

H	Analysis exceeded method hold time.
R	Poor spike recovery accepted because the other spike in the set fell within the given limits.
T	High Replicate Error Ratio (RER) accepted because sample concentrations are less than 10x the MDL.
U	No nuclides detected above the Lower Limit of Detection (LLD)
V	High blank data accepted because sample concentration is 10 times higher than blank concentration
X	QC is out of control. See Case Narrative.
Z	Poor spike recovery is accepted because sample concentration is four times greater than spike concentration.

Method Prefix Reference

M	EPA methodology, including those under SDWA, CWA, and RCRA
SM	Standard Methods for the Examination of Water and Wastewater, 19th edition (1995) & 20th edition (1998).
D	ASTM
RP	DOE
ESM	DOE/ESM

Comments

(1) Solid matrices are reported on a dry weight basis.

(2) Preparation method: "Method" indicates preparation defined in analytical method.

(3) QC results calculated from raw data. Results may vary slightly if the rounded values are used in the calculations.

(4) An asterisk in the "XQ" column indicates there is an extended qualifier and/or certification qualifier associated with the result.

For a complete list of ACZ's Extended Qualifiers, please click: http://www.acz.com/public/extquallist.pdf

Receipt Verification

	YES	NO	NA
1) Does this project require special handling procedures such as CLP protocol?			X
2) Are the custody seals on the cooler intact?	X		
3) Are the custody seals on the sample containers intact?			X
4) Is there a Chain of Custody or other directive shipping papers present?	X		
5) Is the Chain of Custody complete?	X		
6) Is the Chain of Custody in agreement with the samples received?	X		
7) Is there enough sample for all requested analyses?	X		
8) Are all samples within holding times for requested analyses?	X		
9) Were all sample containers received intact?	X		
10) Are the temperature blanks present?			X
11) Are the trip blanks (VOA and/or Cyanide) present?			X
12) Are samples requiring no headspace, headspace free?			X
13) Do the samples that require a Foreign Soils Permit have one?			X

Exceptions: If you answered no to any of the above questions, please describe

Sample Container Preservation Legend

Abbreviation	Description	Container Type	Preservative/Limits
R	Raw/Nitric	RED	pH must be < 2
B	Filtered/Sulfuric	BLUE	pH must be < 2
BK	Filtered/Nitric	BLACK	pH must be < 2
G	Filtered/Nitric	GREEN	pH must be < 2
O	Raw/Sulfuric	ORANGE	pH must be < 2
P	Raw/NaOH	PURPLE	pH must be > 12 *
T	Raw/NaOH Zinc Acetate	TAN	pH must be > 12
Y	Raw/Sulfuric	YELLOW	pH must be < 2
YG	Raw/Sulfuric	YELLOW GLASS	pH must be < 2
N/A	No preservative needed	Not applicable	
RAD	Gamma/Beta dose rate	Not applicable	must be < 250 µR/hr

* pH check performed by analyst prior to sample preparation

Beta performance file: Perb 2254

GAB dry date/time: –

	Yes	No	NA
1) **FOR SREV:** QA/QC approval for initial training or 2 sets of initials for WG & LIMS?	✓		
2) Does the workgroup include all required QC samples?	✓		
3) Are all QC criteria listed in LIMS within specified limits?	✓		
4) Does all QC have the correct nomenclature (PBS vs PBW, etc.)?	✓		
5) For GABs: Beta LCS/MS deleted from Alpha & Alpha LCS/MS deleted from Beta?			✓
6) Are all PCNs / SCNs used for LIMS calculations entered correctly?	✓		
7) Have all transcriptions been reviewed for accuracy (e.g. volumes, BG's, sx counts, etc.)?	✓		
8) Are samples flagged for INSX, if applicable?			✓
9) Is any sample analyzed using less volume appropriately "D" qualified?			✓
10) Are all calculations based on the correct matrix?	✓		
11) Are all errors properly corrected (i.e. single-line crossout, dated & initialed)?	✓		
12) Is a current standard/reagent sheet attached to the workgroup?	✓		
13) Are all associated WG benchsheets locked for editing?	✓		
14) For GAB WG's containing DW samples, did at least 72 hours elapse between end of drying and start of counting?			✓

GAB dry date/time: -

	Yes	No	NA
1) **FOR SREV:** QA/QC approval for initial training or 2 sets of initials for WG & LIMS?	✓		
2) Does the workgroup include all required QC samples?	✓		
3) Are all QC criteria listed in LIMS within specified limits?	✓		
4) Does all QC have the correct nomenclature (PBS vs PBW, etc.)?	✓		
5) For GABs: Beta LCS/MS deleted from Alpha & Alpha LCS/MS deleted from Beta?			✓
6) Are all PCNs / SCNs used for LIMS calculations entered correctly?	✓		
7) Have all transcriptions been reviewed for accuracy (e.g. volumes, BG's, sx counts, etc.)?	✓		
8) Are samples flagged for INSX, if applicable?			✓
9) Is any sample analyzed using less volume appropriately "D" qualified?			✓
10) Are all calculations based on the correct matrix?	✓		
11) Are all errors properly corrected (i.e. single-line crossout, dated & initialed)?	✓		
12) Is a current standard/reagent sheet attached to the workgroup?	✓		
13) Are all associated WG benchsheets locked for editing?	✓		
14) For GAB WG's containing DW samples, did at least 72 hours elapse between end of drying and start of counting?			✓

GAB dry date/time: N/A

	Yes	No	NA
1) **FOR SREV**: QA/QC approval for initial training or 2 sets of initials for WG & LIMS?	✓		
2) Does the workgroup include all required QC samples?	✓		
3) Are all QC criteria listed in LIMS within specified limits?	✓		
4) Does all QC have the correct nomenclature (PBS vs PBW, etc.)?	✓		
5) For GABs: Beta LCS/MS deleted from Alpha & Alpha LCS/MS deleted from Beta?			✓
6) Are all PCNs / SCNs used for LIMS calculations entered correctly?	✓		
7) Have all transcriptions been reviewed for accuracy (e.g. volumes, BG's, sx counts, etc.)?	✓		
8) Are samples flagged for INSX, if applicable?			✓
9) Is any sample analyzed using less volume appropriately "D" qualified?			✓
10) Are all calculations based on the correct matrix?	✓		
11) Are all errors properly corrected (i.e. single-line crossout, dated & initialed)?	✓		
12) Is a current standard/reagent sheet attached to the workgroup?	✓		
13) Are all associated WG benchsheets locked for editing?	✓		
14) For GAB WG's containing DW samples, did at least 72 hours elapse between end of drying and start of counting?			✓

Prep Date: 7-14-10

Approved: MDB
Date: 7-20-10

Weekly background file: 7-15-10
Daily background file: 7-15-10

Alpha performance file: 7-15-10
Beta performance file: —

GAB dry date/time: —

	Yes	No	NA
1) FOR SREV: QA/QC approval for initial training or 2 sets of initials for WG & LIMS?	✓		
2) Does the workgroup include all required QC samples?	✓		
3) Are all QC criteria listed in LIMS within specified limits?	✓		
4) Does all QC have the correct nomenclature (PBS vs PBW, etc.)?	✓		
5) For GABs: Beta LCS/MS deleted from Alpha & Alpha LCS/MS deleted from Beta?			✓
6) Are all PCNs / SCNs used for LIMS calculations entered correctly?	✓		
7) Have all transcriptions been reviewed for accuracy (e.g. volumes, BG's, sx counts, etc.)?	✓		
8) Are samples flagged for INSX, if applicable?			✓
9) Is any sample analyzed using less volume appropriately "D" qualified?			✓
10) Are all calculations based on the correct matrix?	✓		
11) Are all errors properly corrected (i.e. single-line crossout, dated & initialed)?	✓		
12) Is a current standard/reagent sheet attached to the workgroup?	✓		
13) Are all associated WG benchsheets locked for editing?	✓		
14) For GAB WG's containing DW samples, did at least 72 hours elapse between end of drying and start of counting?			✓

cc: Columbia Analytical Services, Inc.

Project ID: K1006636
ACZ Project ID: L82974

Lynda Huckestein:

Enclosed are the analytical results for sample(s) submitted to ACZ Laboratories, Inc. (ACZ) on June 29, 2010. This project has been assigned to ACZ's project number, L82974. Please reference this number in all future inquiries.

All analyses were performed according to ACZ's Quality Assurance Plan. The enclosed results relate only to the samples received under L82974. Each section of this report has been reviewed and approved by the appropriate Laboratory Supervisor, or a qualified substitute.

Except as noted, the test results for the methods and parameters listed on ACZ's current NELAC certificate letter (#ACZ) meet all requirements of NELAC.

This report shall be used or copied only in its entirety. ACZ is not responsible for the consequences arising from the use of a partial report.

All samples and sub-samples associated with this project will be disposed of after August 28, 2010. If the samples are determined to be hazardous, additional charges apply for disposal (typically less than $10/sample). If you would like the samples to be held longer than ACZ's stated policy or to be returned, please contact your Project Manager or Customer Service Representative for further details and associated costs. ACZ retains analytical reports for five years.

If you have any questions or other needs, please contact your Project Manager.

Sue Webber has reviewed and approved this report.

Report Header Explanations

Batch	A distinct set of samples analyzed at a specific time
Found	Value of the QC Type of interest
Limit	Upper limit for RPD, in %.
Lower	Lower Recovery Limit, in % (except for LCSS, mg/Kg)
MDL	Method Detection Limit. Same as Minimum Reporting Limit. Allows for instrument and annual fluctuations.
PCN/SCN	A number assigned to reagents/standards to trace to the manufacturer's certificate of analysis
PQL	Practical Quantitation Limit, typically 5 times the MDL.
QC	True Value of the Control Sample or the amount added to the Spike
Rec	Amount of the true value or spike added recovered, in % (except for LCSS, mg/Kg)
RPD	Relative Percent Difference, calculation used for Duplicate QC Types
Upper	Upper Recovery Limit, in % (except for LCSS, mg/Kg)
Sample	Value of the Sample of interest

QC Sample Types

AS	Analytical Spike (Post Digestion)	LCSWD	Laboratory Control Sample - Water Duplicate
ASD	Analytical Spike (Post Digestion) Duplicate	LFB	Laboratory Fortified Blank
CCB	Continuing Calibration Blank	LFM	Laboratory Fortified Matrix
CCV	Continuing Calibration Verification standard	LFMD	Laboratory Fortified Matrix Duplicate
DUP	Sample Duplicate	LRB	Laboratory Reagent Blank
ICB	Initial Calibration Blank	MS	Matrix Spike
ICV	Initial Calibration Verification standard	MSD	Matrix Spike Duplicate
ICSAB	Inter-element Correction Standard - A plus B solutions	PBS	Prep Blank - Soil
LCSS	Laboratory Control Sample - Soil	PBW	Prep Blank - Water
LCSSD	Laboratory Control Sample - Soil Duplicate	PQV	Practical Quantitation Verification standard
LCSW	Laboratory Control Sample - Water	SDL	Serial Dilution

QC Sample Type Explanations

Blanks	Verifies that there is no or minimal contamination in the prep method or calibration procedure.
Control Samples	Verifies the accuracy of the method, including the prep procedure.
Duplicates	Verifies the precision of the instrument and/or method.
Spikes/Fortified Matrix	Determines sample matrix interferences, if any.
Standard	Verifies the validity of the calibration.

ACZ Qualifiers (Qual)

B	Analyte concentration detected at a value between MDL and PQL. The associated value is an estimated quantity.
H	Analysis exceeded method hold time. pH is a field test with an immediate hold time.
U	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.

Comments

(1)	QC results calculated from raw data. Results may vary slightly if the rounded values are used in the calculations.
(2)	Soil, Sludge, and Plant matrices for Inorganic analyses are reported on a dry weight basis.
(3)	Animal matrices for Inorganic analyses are reported on an "as received" basis.
(4)	An asterisk in the "XQ" column indicates there is an extended qualifier and/or certification qualifier associated with the result.

Report Header Explanations

Batch	A distinct set of samples analyzed at a specific time
Error(+/-)	Calculated sample specific uncertainty
Found	Value of the QC Type of interest
Limit	Upper limit for RPD, in %.
LCL	Lower Control Limit, in % (except for LCSS, mg/Kg)
LLD	Calculated sample specific Lower Limit of Detection
PCN/SCN	A number assigned to reagents/standards to trace to the manufacturer's certificate of analysis
PQL	Practical Quantitation Limit
QC	True Value of the Control Sample or the amount added to the Spike
Rec	Amount of the true value or spike added recovered, in % (except for LCSS, mg/Kg)
RER	Relative Error Ratio, calculation used for Dup. QC taking into account the error factor.
UCL	Upper Control Limit, in % (except for LCSS, mg/Kg)
Sample	Value of the Sample of interest

QC Sample Types

DUP	Sample Duplicate	MS/MSD	Matrix Spike/Matrix Spike Duplicate
LCSS	Laboratory Control Sample - Soil	PBS	Prep Blank - Soil
LCSW	Laboratory Control Sample - Water	PBW	Prep Blank - Water

QC Sample Type Explanations

Blanks	Verifies that there is no or minimal contamination in the prep method procedure.
Control Samples	Verifies the accuracy of the method, including the prep procedure.
Duplicates	Verifies the precision of the instrument and/or method.
Matrix Spikes	Determines sample matrix interferences, if any.

ACZ Qualifiers (Qual)

H	Analysis exceeded method hold time.
R	Poor spike recovery accepted because the other spike in the set fell within the given limits.
T	High Replicate Error Ratio (RER) accepted because sample concentrations are less than 10x the MDL.
U	No nuclides detected above the Lower Limit of Detection (LLD)
V	High blank data accepted because sample concentration is 10 times higher than blank concentration
X	QC is out of control. See Case Narrative.
Z	Poor spike recovery is accepted because sample concentration is four times greater than spike concentration.

Method Prefix Reference

M	EPA methodology, including those under SDWA, CWA, and RCRA
SM	Standard Methods for the Examination of Water and Wastewater, 19th edition (1995) & 20th edition (1998).
D	ASTM
RP	DOE
ESM	DOE/ESM

Comments

(1) Solid matrices are reported on a dry weight basis.

(2) Preparation method: "Method" indicates preparation defined in analytical method.

(3) QC results calculated from raw data. Results may vary slightly if the rounded values are used in the calculations.

(4) An asterisk in the "XQ" column indicates there is an extended qualifier and/or certification qualifier associated with the result.

For a complete list of ACZ's Extended Qualifiers, please click: http://www.acz.com/public/extquallist.pdf

ACZ Project ID: ***L82974***

Radiochemistry

The following parameters are not offered for certification or are not covered by NELAC certificate #ACZ.

Lead 210 (3050)	Eichrom
Thorium 230 (3050)	ESM 4506
Uranium 234	Eichrom
Uranium 235	Eichrom
Uranium 238	Eichrom

ACZ Laboratories, Inc.
2773 Downhill Drive Steamboat Springs, CO 80487 (800) 334-5493

Sample Receipt

K1006636

ACZ Project ID: L82974
Date Received: 06/29/2010 10:31
Received By: gac
Date Printed: 6/30/2010

Receipt Verification

	YES	NO	NA
1) Does this project require special handling procedures such as CLP protocol?			X
2) Are the custody seals on the cooler intact?	X		
3) Are the custody seals on the sample containers intact?			X
4) Is there a Chain of Custody or other directive shipping papers present?	X		
5) Is the Chain of Custody complete?	X		
6) Is the Chain of Custody in agreement with the samples received?	X		
7) Is there enough sample for all requested analyses?	X		
8) Are all samples within holding times for requested analyses?	X		
9) Were all sample containers received intact?	X		
10) Are the temperature blanks present?			X
11) Are the trip blanks (VOA and/or Cyanide) present?			X
12) Are samples requiring no headspace, headspace free?			X
13) Do the samples that require a Foreign Soils Permit have one?			X

Exceptions: If you answered no to any of the above questions, please describe

N/A

Contact (For any discrepancies, the client must be contacted)

Data Reviewer: ZSH
Date: 7-12-10

Approved: BRD
Date: 7.12.10

Analyst: ZACH HOLLADAY

Workgroup: 285851

Analysis Date: 7-12-10

Sample type used: AS-REC, SOIL

Extraction / Digestion / Analysis / Prep / Calc:

	Yes	No	N/A
1. Is the raw data checked to the computer printout for transcription errors?	✓		
2. Is the %solid or TS attached for dilution factors?			✓
3. Were proper volumes of reagents used per final volume?			✓
4. Was the proper sub-sample used (as received, <2000, <500, <250, dry)?	✓		
5.Were the dilution factor calculation checked (final volume, weight, %solid)?			✓
6. Did the RPD pass?			✓
7. Does all the spike information correlate with each other?			✓
8. Is the appropriate spike in the computer-designated line?			✓
9. Are all errors properly corrected (single-line crossout, dated & initialed)?	✓		
10. Is the standard/reagent information complete and current?			✓
FOR SREV: QA/QC approval for initial training or 2 sets of initials for WG & LIMS?	✓

Analysis Date: 7/15/2010

Sample type used: <2000

Extraction / Digestion / Analysis / Prep / Calc: 3050

	Yes	No	N/A
1. Is the raw data checked to the computer printout for transcription errors?	✓		
2. Is the %solid or TS attached for dilution factors?	✓		
3. Were proper volumes of reagents used per final volume?	✓		
4. Was the proper sub-sample used (as received, <2000, <500, <250, dry)?	✓		
5.Were the dilution factor calculation checked (final volume, weight, %solid)?	✓		
6. Did the RPD pass?			✓
7. Does all the spike information correlate with each other?			✓
8. Is the appropriate spike in the computer-designated line?			✓
9. Are all errors properly corrected (single-line crossout, dated & initialed)?	✓		
10. Is the standard/reagent information complete and current?	✓		
FOR SREV: QA/QC approval for initial training or 2 sets of initials for WG & LIMS?

Analysis Date: 7/14/2010

Sample type used: DRY

Extraction / Digestion / Analysis / ~~Prep~~ Calc: SP- CP

	Yes	No	N/A
1. Is the raw data checked to the computer printout for transcription errors?	✓		
2. Is the %solid or TS attached for dilution factors?			✓
3. Were proper volumes of reagents used per final volume?			✓
4. Was the proper sub-sample used (as received, <2000, <500, <250, (dry))?	✓		
5. Were the dilution factor calculation checked (final volume, weight, %solid)?			✓
6. Did the RPD pass? BRD 7/16/10	✓		✓
7. Does all the spike information correlate with each other?			✓
8. Is the appropriate spike in the computer-designated line?			✓
9. Are all errors properly corrected (single-line crossout, dated & initialed)?	✓		
10. Is the standard/reagent information complete and current?	✓		
FOR SREV: QA/QC approval for initial training or 2 sets of initials for WG & LIMS?	✓

Radiochemistry Data Review Checklist

Data Reviewer: MWM
Date: 7-26-10

Approved: MWB
Date: 7-26-10

Work Group: WG286455
Sample Type: Soil
Analysis Date: 7-20-10
Analyst: TCD
Prep Date: 7-19-10

Weekly background file: Back612
Daily background file: Back614

Alpha performance file: Perf412
Beta performance file: —

GAB dry date/time: —

	Yes	No	NA
1) **FOR SREV**: QA/QC approval for initial training or 2 sets of initials for WG & LIMS?	✓		
2) Does the workgroup include all required QC samples?	✓✓		
3) Are all QC criteria listed in LIMS within specified limits?	✓✓		
4) Does all QC have the correct nomenclature (PBS vs PBW, etc.)?	✓✓		
5) For GABs: Beta LCS/MS deleted from Alpha & Alpha LCS/MS deleted from Beta?			✓✓
6) Are all PCNs / SCNs used for LIMS calculations entered correctly?	✓✓		
7) Have all transcriptions been reviewed for accuracy (e.g. volumes, BG's, sx counts, etc.)?	✓✓		
8) Are samples flagged for INSX, if applicable?			✓✓
9) Is any sample analyzed using less volume appropriately "D" qualified?			✓✓
10) Are all calculations based on the correct matrix?	✓✓		
11) Are all errors properly corrected (i.e. single-line crossout, dated & initialed)?	✓✓		
12) Is a current standard/reagent sheet attached to the workgroup?	✓✓		
13) Are all associated WG benchsheets locked for editing?	✓✓		
14) For GAB WG's containing DW samples, did at least 72 hours elapse between end of drying and start of counting?			✓✓

Beta performance file: —

GAB dry date/time: —

	Yes	No	NA
1) FOR SREV: QA/QC approval for initial training or 2 sets of initials for WG & LIMS?			
2) Does the workgroup include all required QC samples?	✓		
3) Are all QC criteria listed in LIMS within specified limits?	✓		
4) Does all QC have the correct nomenclature (PBS vs PBW, etc.)?	✓		
5) For GABs: Beta LCS/MS deleted from Alpha & Alpha LCS/MS deleted from Beta?			✓
6) Are all PCNs / SCNs used for LIMS calculations entered correctly?	✓		
7) Have all transcriptions been reviewed for accuracy (e.g. volumes, BG's, sx counts, etc.)?	✓		
8) Are samples flagged for INSX, if applicable?			✓
9) Is any sample analyzed using less volume appropriately "D" qualified?			✓
10) Are all calculations based on the correct matrix?	✓		
11) Are all errors properly corrected (i.e. single-line crossout, dated & initialed)?	✓		
12) Is a current standard/reagent sheet attached to the workgroup?	✓		
13) Are all associated WG benchsheets locked for editing?	✓		
14) For GAB WG's containing DW samples, did at least 72 hours elapse between end of drying and start of counting?			✓

GAB dry date/time: —

	Yes	No	NA
1) **FOR SREV:** QA/QC approval for initial training or 2 sets of initials for WG & LIMS?	✓		
2) Does the workgroup include all required QC samples?	✓		
3) Are all QC criteria listed in LIMS within specified limits?	✓		
4) Does all QC have the correct nomenclature (PBS vs PBW, etc.)?	✓		
5) For GABs: Beta LCS/MS deleted from Alpha & Alpha LCS/MS deleted from Beta?			✓
6) Are all PCNs / SCNs used for LIMS calculations entered correctly?	✓		
7) Have all transcriptions been reviewed for accuracy (e.g. volumes, BG's, sx counts, etc.)?	✓		
8) Are samples flagged for INSX, if applicable?			✓
9) Is any sample analyzed using less volume appropriately "D" qualified?			✓
10) Are all calculations based on the correct matrix?	✓		
11) Are all errors properly corrected (i.e. single-line crossout, dated & initialed)?	✓		
12) Is a current standard/reagent sheet attached to the workgroup?	✓		
13) Are all associated WG benchsheets locked for editing?	✓		
14) For GAB WG's containing DW samples, did at least 72 hours elapse between end of drying and start of counting?			✓

GAB dry date/time: —

	Yes	No	NA
1) **FOR SREV:** QA/QC approval for initial training or 2 sets of initials for WG & LIMS?	✓		
2) Does the workgroup include all required QC samples?	✓		
3) Are all QC criteria listed in LIMS within specified limits?	✓		
4) Does all QC have the correct nomenclature (PBS vs PBW, etc.)?	✓		
5) For GABs: Beta LCS/MS deleted from Alpha & Alpha LCS/MS deleted from Beta?			✓
6) Are all PCNs / SCNs used for LIMS calculations entered correctly?	✓		
7) Have all transcriptions been reviewed for accuracy (e.g. volumes, BG's, sx counts, etc.)?	✓		
8) Are samples flagged for INSX, if applicable?			✓
9) Is any sample analyzed using less volume appropriately "D" qualified?			✓
10) Are all calculations based on the correct matrix?	✓		
11) Are all errors properly corrected (i.e. single-line crossout, dated & initialed)?	✓		
12) Is a current standard/reagent sheet attached to the workgroup?	✓		
13) Are all associated WG benchsheets locked for editing?	✓		
14) For GAB WG's containing DW samples, did at least 72 hours elapse between end of drying and start of counting?			✓
