**RE: EISB Pilot Study Status Report #4
DuPont Pompton Lakes Works
Pompton Lakes, New Jersey**

Dear Mr. Flax:

Enclosed is the monthly status report that summarizes activities associated with the interim remedial measure (IRM) pilot study using enhanced in-situ bioremediation (EISB) being conducted in accordance with the Agency-approved *Implementation Work Plan for Application of EISB to Intermediate Groundwater Near Well 128* dated January 31, 2012 and *Technical Memorandum –Response to Comments* dated March 30, 2012.

This status report covers the time period of October 1 through 31, 2013.

If you have any questions, please contact me at (973) 492-7733.

Sincerely,

A handwritten signature in black ink that reads "David E. Epps".

David E. Epps, P.G.

Monthly Progress Report – EISB Pilot Study
Report Period – October 1, 2013 through October 31, 2013

DuPont Pompton Lakes Works
Pompton Lakes, New Jersey

This monthly report summarizes activities completed from October 1 to 31, 2013 associated with the interim remedial measure (IRM) pilot study using enhanced in-situ bioremediation (EISB) in the intermediate aquifer in the area of monitoring well cluster 128 (see Figure 1 for Site layout). Work is being conducted in accordance with the Agency-approved *Implementation Work Plan for Application of EISB to Intermediate Groundwater Near Well 128* dated January 31, 2012 and *Technical Memorandum – Response to Comments* dated March 30, 2012.

Activities Completed During Reporting Period (October 1, 2013 to October 31, 2013)

Activities completed during the reporting period included system operation and sampling.

Recirculation System Operation/Maintenance

- Groundwater was extracted from EW01 at a rate of approximately 2 gallons per minute (GPM) between October 1st and October 8th. On October 8th, the flow system was shut down for mechanical rehabilitation of EW01.
- Bromide concentrations in groundwater were monitored on October 2nd prior to EW01 rehabilitation activities.
- Sodium lactate was amended to the re-injected groundwater once per day from October 1st to October 8th at a target time weighted average of lactate at 165 milligrams per liter (mg/L).
- Routine system maintenance (e.g., particulate filter change outs, flow rate adjustments) were conducted between October 1st and October 8th. Routine system maintenance has not been conducted since the system was shut down for rehabilitation activities on October 8th.
- There was one leak detection sensor alarm in the injection well vault on October 3rd. The system was inspected for leaks and after none were detected, the alarm was cleared and the system was reset.
- No high pressure alarms occurred between October 1st and 31st.
- Mechanical rehabilitation of EW01 occurred October 9th and 10th. No sediment was found in the bottom of EW01. Evidence of biological fouling was found on the pump and inside of the discharge piping.
- A standard operating procedure was developed to complete an alternative treatment of EW01 using Nu-Well 110 (granular acid) and Nu-Well 310 (bioacid dispersant that breaks down biofilm and disperses mineral salts). Both of these products are specifically designed for use

in well rehabilitation and will be used in accordance with the manufacturer's specifications. Following treatment, EW01 will be thoroughly pumped until the pH of the pumped water is within +/- 1 standard units of groundwater pH prior to treatment. This work is scheduled to be completed on November 4th and 5th, with system restart planned for November 6th.

Results to Date

Groundwater Pumping

From system start-up (June 24, 2013) to October 31, 2013, the total recirculated groundwater was 343,060 gallons.

Water Level Monitoring

Manual water level measurements were collected on October 2nd (during system operation) and on October 16th (while the system was shut down during rehabilitation activities) in the surrounding monitoring wells (Table 1). Results are reported as depth-to-water in units of feet below top of casing (ft btoc) and as the converted elevation in units of feet relative to mean sea level (ft msl). Level logger data from IW01, IW02, IW03, EW01, 128I, and 128S will be included in the final pilot study report. Drawdown in the extraction well (EW01) during operation is typically 14 feet and mounding at IW02 is 3.5 feet (based on data from level loggers). However, prior to system rehabilitation, drawdown in EW01 increased to approximately 45 feet. On September 10th, the extraction well flow rate was adjusted down to 2 GPM to help decrease the rate of drawdown in EW01. Mechanical rehabilitation was completed between October 9th and 10th and further rehabilitation is planned for early November 2013. Following rehabilitation activities, the extraction well flow rate will be adjusted back to 3 GPM.

Water Quality Monitoring

Groundwater samples were not collected during the reporting period from the wells in the 128 area since the system was shut down for rehabilitation activities at EW01. A summary of the water quality field parameter data recorded during well purging and prior to sampling is provided in Table 2 and the volatile organic compound (VOC), dissolved hydrocarbon gases (DHG), and total organic carbon (TOC) data from baseline up to the third monthly sampling event (September 25th) is presented in Table 3. The results prior to EW01 rehabilitation indicate that VOC concentrations of dichloroethene (cis and trans), vinyl chloride, ethane, and ethane are starting to increase slightly in the target intermediate zone of ML02, ML04, and EW01. Slight increases in ethene and ethane have also been seen in the same zone in ML02, ML04, and EW01. A complete copy of the analytical results generated during these events will be provided in the final study report.

Bromide Tracer Monitoring

Bromide detections at the various well locations are shown in Figure 2. The intent of the bromide measurements is to serve as a tracer to groundwater flow under re-circulating conditions and to aid in the understanding of extraction well capture efficiency, pore volume estimations, and correlating changes in VOC concentrations to EISB-related activities. Potassium bromide was continuously amended to the re-injected groundwater from June 24th through August 16th.

Results to date for the field analysis of bromide indicate that re-injected groundwater has reached the target intermediate zone (nominally from 40 to 65 feet below ground surface [ft bgs]) in ML02 and ML04. Bromide has been detected in the intermediate zone at IW03 (the closest injection well) and IW01 at a maximum of 54 mg/L (August 20th) and 53 mg/L (September 5th), respectively. EW01 concentrations had spiked at 22 mg/L on September 5th. By October 2nd, concentrations had decreased below 10 mg/L. Based on the observed bromide concentrations in the extraction well at the end of four months of operation, it appears the travel time of bromide is longer than anticipated. By October 2nd, bromide concentrations in the target intermediate zone continued to remain below 20 mg/L which indicates that the center of mass had passed through the system in September as shown in Figure 2. No further sampling of bromide will occur in November and December 2013.

Summary

Once EW01 has been rehabilitated to sustainable conditions, the system will be turned back on and amendment of lactate will proceed throughout the month of November. Future groundwater monitoring activities will continue to monitor concentrations of key parameters in order to evaluate the operation and performance of the EISB system.

Activities Scheduled for Next Reporting Period (November 1~30, 2013)

Activities to be completed during November 2013 include:

- Alternative treatment of EW01 (week of November 4th),
- Re-startup of the EISB system following rehabilitation of EW01,
- Continued operation of the pilot-scale EISB system,
- 4th monthly monitoring event (week of November 18th).

The system will be routinely checked to confirm operation and monitor groundwater flow conditions.

Notes:

< Less than the laboratory reporting limit shown

-- Analyte not measured

Laboratory-Assigned Qualifiers

J Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL).

R Associated MS and/or MSD analysis had relative percent recovery values less than the data rejection level. The reported non-detect result is unusable.

Definitions

ft bgs	feet below ground surface
CT	carbon tetrachloride
