Quality Control

Chemicals for Spikes

The following spikes have been selected for incinerator testing:

Mercury (II) nitrate hydrate	[high volatility metal]
Lead nitrate	[medium volatility metal]
Chromic acid	[low volatility metal]
Hexachloroethane	[chlorine source]

These chemicals were purchased from suppliers and delivered to the facility. Specification sheets or Certificates of Analysis with any applicable lot or batch numbers are provided for each of these chemicals in the attachments to this writing.

The Mercury (II) nitrate hydrate will be put into solution with de-ionized (DI) water and slightly acidified with concentrated Omni-trace nitric acid (specification sheet included in attachments) to help prevent any precipitation of solids. Pre-determined amounts of this solution will be fed during incinerator testing within plastic vials placed with the solid feed charges. Because the targeted mercury feed rate is significantly greater for the testing of No. 4 Incinerator, two different concentrations of Mercury nitrate solution batches will be prepared for use as spikes in the incinerator feeds.

The Lead nitrate will be put into re-closable plastic bags in pre-determined amounts and fed to the incinerators during testing by placing them with the solid feed charges.

The Chromic acid with a concentration of 35% will be fed to the incinerators at a pre-determined rate via metering pumps on an electronic scale device.

The Hexachloroethane will be put into re-closable plastic bags in pre-determined amounts and fed to the incinerators during testing by placing them with the solid feed charges.

Certification of Spike Measuring Equipment

The Mercury (II) nitrate hydrate will be measured out for the prepared solution in the facility laboratory based on calculated values. A mass balance certified for accuracy by a professional scale services company will be used. It is also calibrated before use as part of daily laboratory protocol. Class A graduated flasks and other selected laboratory equipment will be used for measuring out liquids for the given solution. A certified repipet dispenser will be used for filling individual vials. The concentration of the prepared Mercury solution will be confirmed by the laboratory.

The weighing devices used for measuring out the Lead nitrate spike bags and the Hexachloroethane spike bags are electronic scales with digital readout and control panels. They have been calibrated prior to use by a professional scale services company. Each scale panel bears a sticker indicating the calibration date and a written report on the calibration is

prepared. In addition, the procedures for preparing these spike bags require the scales to be zeroed on a consistent basis during use.

The device used for feeding Chromic acid combines a holding tank, metering pumps and an electronic scale with a digital readout and control panel. It has been calibrated prior to use by a professional scale services company. The scale panel bears a sticker indicating the calibration date and a written report on the calibration is prepared.

Chain of Custody

The purchased Mercury (II) nitrate hydrate will be recorded in the Product and Reagents Logbook upon receipt, assigned a tracking number and stored in the laboratory. The jars of product will be opened at the time designated to prepare the Mercury solutions. When the Mercury solutions have been prepared, the gasketed 5-gallon pails used to contain the solution will be sealed with tape across the lid with the Laboratory Manager's signature on the tape on two sides of the pail. When the pails are not in visual contact of the Laboratory Manager, they will be stored in his locked office. When the vials of Mercury solution are to be prepared, the tape on the pails must be intact with no sign it has been tampered with or been cut. If the integrity of the tape has been compromised, the Mercury solution will be considered invalid and a new solution will have to be prepared.

The Lead nitrate, Hexachloroethane and Chromic acid will be stored in their original shipping packaging in a designated indoor storage area within the facility. The Lead nitrate and Hexachloroethane containers will be opened when it is time to prepare the individual spike packages. The drums of Chromic acid will be opened as needed during the incinerator testing when they are placed on the feeding device.

Spike Preparation Procedures

The procedures written below are the steps taken by personnel when preparing and/or measuring out and documenting the spikes used for incinerator testing.

Mercury Nitrate Spike Solution Preparation Procedure

NOTE: Calculations for preparing Mercury solutions of a defined quantity and concentration are included as attachments to this writing.

1. Obtain the necessary chemicals and laboratory equipment.
2. Fill a 100 ml Class A graduated flask to line with DI water and pour into a designated 5 gallon pail.
3. Repeat as needed for additional DI water depending on the final volume of solution needed. The last 100 ml portion will be filled for later in the procedure to use in rinsing equipment and completing the final solution volume.

4. Fill the appropriate Class A graduated flask(s) with the applicable volume of Nitric acid and pour it into the 5 gallon pail. The volume needed will represent 10% of the total volume of solution needed.
5. Tare a beaker on the mass balance then add the designated amount of Mercury (II) nitrate hydrate.
6. Empty the beaker into the 5 gallon pail. Then rinse the beaker three times with an appropriate portion of the reserved 100 ml DI water.
7. After rinsing is complete, add the remaining DI water in the 100 ml flask to the solution in the 5 gallon pail to obtain the final desired volume.
8. Record the quantities of chemicals placed in the 5 gallon pail in the Laboratory logbook.
9. Stir the solution with a rinsed plastic tube until there is no visual evidence of undissolved Mercury (II) nitrate hydrate.
10. Pull 2 aliquots of approximately 50 ml of Mercury solution for subsequent analysis.
11. Close the 5 gallon pail with a gasketed lid and follow the requirements for Chain of Custody for the Mercury solution.

Mercury Spike Vial Preparation Procedure

1. Obtain the applicable Mercury solution and plastic vials.
2. Rinse the repipet dispenser and transfer container used for measuring Mercury nitrate solution first with DI water, then twice with a portion of the solution.
3. Transfer desired amount of the selected Mercury nitrate solution from the storage vessel to the transfer container. The concentration of the solution is dependent on which incinerator the spike vials are being prepared for.
4. Position equipment within a laboratory hood.
5. Calibrate the repipet-pump by selecting a Class A volumetric flask of the applicable size and dispensing the solution into the flask while adjusting the repipet pump as needed to achieve the specific volume. This calibration step should be repeated after every 100 vials are filled.
6. Number each vial needed with a label starting at number “1”.

7. Using the repipet-pump, transfer the specified amount of Mercury nitrate solution into the vial. The amount of solution transferred to the vial is dependent on which incinerator the spike vials are being prepared for.
8. Document the vial number and volume on the spike vial sheet.
9. Securely seal the vial and carefully place it into a plastic storage bucket.
10. Repeat steps for number of spike vials needed.
11. When complete, close the plastic storage buckets and place in designated area. All personnel involved in preparing the vials must have their names written on the spike vial sheet.

Lead Nitrate Spike Bag Preparation Procedure

1. Obtain Lead nitrate raw material and re-closable plastic bags.
2. Position electronic scales in the selected area and zero the scales before use.
3. Put on required PPE before exposure to the Lead nitrate. Personnel directly handling Lead nitrate need dust mask, Tyvek suit, and nitrile gloves.
4. Number each plastic bag needed with a label starting at "L-1".
5. Open a bag of raw material and use scoop or equivalent device to place the specified amount of Lead nitrate into the numbered plastic bag.
6. Document the bag number and weight on the spike bag sheet.
7. Securely seal the bag and carefully place it into a plastic storage drum.
8. Repeat steps for number of spike bags needed. Re-zero the scale at least once every 100 bags.
9. When complete, close and seal the plastic storage drums and place in the designated area. All personnel involved in preparing the bags must have their names written on the spike bag sheet.

Hexachloroethane Spike Bag Preparation Procedure

1. Obtain Hexachloroethane raw material and re-closable plastic bags.
2. Position electronic scales in the selected area and zero the scales before use.

3. Put on required PPE before exposure to the Hexachloroethane. Personnel directly handling Hexachloroethane need a full-face respirator with OV/AG cartridges, Tyvek suit, and nitrile gloves.
4. Number each plastic bag needed with a permanent marker starting at "H-1".
5. Open a bag of raw material and use scoop or equivalent device to place specified amount of Hexachloroethane and/or PVC into the numbered plastic bag.
6. Document the bag number and weight on the spike bag sheet.
7. Securely seal the bag and carefully place it into a plastic storage drum.
8. Repeat steps for number of spike bags needed. Re-zero the scale at least once every 100 bags.
9. When complete, close and seal the plastic storage drums and place in the designated area. All personnel involved in preparing the bags must have their names written on the spike bag sheet.

Spike Feeding Procedures

The procedures written below are the steps taken by personnel when feeding spikes used for incinerator testing.

Feeding Procedure for Mercury, Lead and Chlorine Spikes

1. Position the Mercury nitrate spike vials, the Lead nitrate spike bags and the Hexachloroethane near the loading point on the solid charge feed conveyor.
2. Place one spike container of each chemical into each charge. Because the mercury feed rates are dependent on the incinerator, the correct spike vial must be fed to the respective incinerator.
3. Document the waste charge number, vial number and bag numbers on the charge sheet. All personnel involved in feeding the charges must have their names written on the charge sheet.

Feeding Procedures for Chromium Spike

1. Place the feeding device and selected drums of Chromic acid near the injection point on the incinerator.
2. Activate the power panel for the feeding device and zero the electronic scales.

3. Put on the Personnel Protective Equipment recommended by the MSDS for Chromic Acid and transfer the desired amount of material to the holding tank on the feeding device.
 4. At the designated time, start the metering pumps and select pump settings that deliver the targeted feed rate.
 5. Document scale readings and time at selected intervals on the Chromic acid feed chart to verify that the desired feed rate is being achieved during the incinerator testing period. All personnel involved in feeding the Chromic acid must have their names written on the feed chart.

Revision: 04/21/08 WES

IMDS ID No.: 756617

Technical Information

CHROMIC ACID

Liquid (35%)

INTRODUCTION

CHROMIC ACID Liquid (35%) is a high-purity product well suited for use in chromium plating and anodizing applications. It can also be used in the manufacture of chromate conversion compounds for zinc and cadmium, bright dips for copper, brass, aluminum, and magnesium, for producing certain types of pigments, as an oxidant in organic syntheses in the pharmaceutical industry, and as a catalyst in certain petroleum refining processes.

Quality Control Certificate & Instrument Warranty

G B WARRANTY This instrument is guaranteed for 12 months. This certificate of quality control is valid for the enclosed apparatus. These test results are to ISO standard 8655 and show imprecision and inaccuracy of stated maximum nominal volume using distilled water @ 20,000 °C..

D GARANZIA Wir leisten 12 Monate Garantie gegen Vorlage dieses Prüfprotokolls. Dieses Prüfprotokoll wurde für das beliegende Gerät erstellt. Dieses Testergebnisse entsprechen ISO Norm 8655 und weisen eine Ungenauigkeit des angegebenen maximalen Nenninhalts bei Verwendung von destilliertem Wasser bei 20,000 °C auf.

F GARANTIE Nous accordons une garantie de 12 mois pour tout appareil acheté en notre société. Ce certificat a été établi pour l'appareil suivant. Les résultats des essais sont conforme à la norme ISO 8655 et font ressortir une imprecision et une inexactitude du volume dans les limites de la valeur nominale maximale admissible avec de l'eau distillée à 20,000 °C.

E GARANTIA Concedemos contra la presentación de este certificado 12 meses de garantía. Este certificado de control de calidad es válido para el aparato adjunto. Los resultados de estos ensayos conforman con la norma ISO 8655 y muestran la imprecision e inexactitud del volumen nominal maximo declarado usando agua destilada a 20,000 °C.

Quality Compliance CERTIFICATE of Conformity

These products are subject to our highest standard of quality assurance. At every stage of production this manufacturing lot of items is produced in a controlled environment and is traceable. We test every lot of these products to ensure they perform to your needs.

We guarantee that these products meet our strictest requirements as applicable for precision, clarity, warp, centrifugation and are free of detectable contamination that might affect your results. Should you find these products fail to meet our published standards please contact us for a replacement.

To receive a testing certificate for a specific lot number please contact our Customer Support Department.

Analysis Certificate

This certificate of compliance is issued to confirm that this lot of products conforms to our written material specifications and has been tested and found as applicable to be:

- Free of detectable Nuclease contaminants as confirmed by a gel assay.
- Free of Human DNA to a detection level of 1 picogram of DNA.
- If this is a sterile product this lot has been tested and found to be free of Endotoxin to a detection level of 0.05EU/mL.
- Sterile studies to detect microbial contamination are completed quarterly in compliance with AAMI/ISO 11137 and these products have an SAL between 10^{-5} and 10^{-6} .
- The resins used to produce these products have been tested for heavy metals contamination using the U.S.P. (231) method and found to have results lower than 1ppm.

Testing protocols are described on the reverse
Rev. New

-) Testing Protocols Used in Quality Assurance
 -) Product Sterilization
 - Those products designated as Sterile are irradiated by gamma radiation. The validated dosage level for these products is in a range between 12-25 kGy.
 -) Bioburden and Radiation Validation
 - Bioburden and Radiation Validation studies are performed according to the ANSI/AAMI/ISO 11137 standard. This testing is performed quarterly by an independent laboratory.
 -) Endotoxin Detection (Pyrogen)
 - Samples of these products are extracted in endotoxin-free water and tested for endotoxins using the kinetic turbidimetric method of the Limulus Amoebocyte Lysate (LAL) test according to the USP standard. The minimum detection level for this test is 0.05 EU/mL.
 -) Nuclease Detection
 - For RNase testing, sample products are flushed in 20µL pools containing 1µg of 7.5 kb Poly(A)-tailed RNA with a buffer containing NaCl and MgCl₂. For the DNase test, product samples are flushed in 20µL pools containing of 1.0µg of 1Hind III DNA with a buffer containing NaCl and MgCl₂. Reactions are then incubated for 1 hour at 37° C then visualized in an agarose gel. The results are then compared to negative and positive controls. The resulting reactions must show no degradation of the DNA and RNA fragments to meet our quality standard.
- Rev. New

DNA Contamination

Each product sample is extracted with sterile, DNA-free water. A portion of the extract is added to a PCR reaction containing thermostable polymerase, a primer set to amplify a mammalian gene, and dNTPs. Negative control reactions and positive control reactions (containing 1 picogram of Human Genomic DNA) are also created. All reactions are thermocycled for 40 cycles, after which the results are visualized by agarose gel electrophoresis. The absence of PCR signal in the sample reactions indicates the product is free of DNA contamination.

To receive a Testing Certificate for a specific lot number, please contact our Customer Support Department at:

800.227.1466 or ++ 1.707.766.2100

or Fax us at

800.648.4859 or ++ 1.707.766.2199

with the lot number of your product.

MERCURY CONCENTRATION FOR MERCURY (II) NITRATE HYDRATE, LOT NO. A28Z031

From Certification of Analysis for Lot No. A28Z031:

Assay = 99.5 wt. % $\text{Hg}(\text{NO}_3)_2 \cdot x \text{ H}_2\text{O}$ $x = 1$ or 2

Also contains 0.12 wt. % Mercury in 1+ oxidation state (Mercury (I) or Mercurous mercury)

Estimated Average Molecular Weight and Percent Mercury by Weight:

$\text{Hg}(\text{NO}_3)_2 \cdot \text{H}_2\text{O} : 200.6 + 2[14.01 + (3 \times 16.00)] + 18.02 = 342.6$ amu

$\text{Hg}(\text{NO}_3)_2 \cdot 2 \text{ H}_2\text{O} : 200.6 + 2[14.01 + (3 \times 16.00)] + 2(18.02) = 360.7$ amu

For 50/50 ratio of monohydrate/dihydrate:

$200.6 / ((342.6 + 360.7) / 2) \times 100 = 57.05$ wt. % Mercury in $\text{Hg}(\text{NO}_3)_2 \cdot x \text{ H}_2\text{O}$

For 99.5% assay and 0.12% Mercurous mercury of Lot No. A28Z031:

$0.995(57.05) + 0.12 = 56.88$ wt. % Mercury

MERCURY SOLUTION FOR NO. 2 AND NO. 3 INCINERATORS

Targeted Mercury feed rates:

0.002 lb Mercury / hour

40 vials solution / hour @ 10 ml solution / vial *

56.88 wt. % Mercury in $\text{Hg}(\text{NO}_3)_2 \cdot \text{x H}_2\text{O}$

Estimated Total Solution Needed:

10 ml/vial (40 vial/hr)(4 hr/test)(3 test/incin)(2 incin) = 9600 ml = 9.6 liters

9.6 liters + safety factor = 12 liters Mercury solution

For 12 Liters of Mercury Solution:

0.002 lb Hg/hr (453.6 gm/lb) / 40 vials/hr = 0.02268 gm Hg/vial

(0.02268 gm Hg/vial) / (10 ml soln/vial) * 1000 ml/lit * 12 lit / 0.5688 =

47.85 gm $\text{Hg}(\text{NO}_3)_2 \cdot \text{x H}_2\text{O}$ in 12 liters solution

Amounts of Components for Preparation of Mercury Solution for No. 2 and No. 3 Incinerators:

47.85 gm +/-. 0.05 gm $\text{Hg}(\text{NO}_3)_2 \cdot \text{x H}_2\text{O}$

10.8 liters de-ionized water

1.2 liters conc. Nitric acid

*Volumes may be modified based on concentrations in the native waste fed.

MERCURY SOLUTION FOR NO. 4 INCINERATOR

Targeted Mercury feed rates:

0.04 lb Mercury / hour

40 vials solution / hour @ 20 ml solution / vial*

56.88 wt. % Mercury in $\text{Hg}(\text{NO}_3)_2 \cdot \text{x H}_2\text{O}$

Estimated Total Solution Needed:

20 ml/vial (40 vial/hr)(4 hr/test)(3 test/Incinerator) = 9600 ml = 9.6 liters

9.6 liters + safety factor = 12 liters Mercury solution

For 12 Liters of Mercury Solution:

0.04 lb Hg/hr (453.6 gm/lb) / 40 vials/hr = 0.4536 gm Hg/vial

(0.4536 gm Hg/vial) / (20 ml soln/vial) \times 1000 ml/lit \times 12 lit / 0.5688 =

478.5 gm $\text{Hg}(\text{NO}_3)_2 \cdot \text{x H}_2\text{O}$ in 12 liters solution

Amounts of Components for Preparation of Mercury Solution for No. 4 Incinerator:

478.5 gm $\text{Hg}(\text{NO}_3)_2 \cdot \text{x H}_2\text{O}$

10.8 liters de-ionized water

1.2 liters conc. Nitric acid

*Volumes may be modified based on concentrations in the native waste fed.
