#### INTRODUCTION

### Scope and Applicability

This SOP offers detailed guidance in evaluating laboratory data generated according to "SW846-Method 8270D" January 1998. Method 8270D is used to determine the concentration of semivolatile organic compounds in extracts prepared from many types of solid waste matrices, soils, air sampling media and water samples. The validation methods and actions discussed in this document are based on the requirements set forth in SW846 Method 8270D, Method 8000C and the "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review," January 2005. This document covers technical problems specific to each fraction and sample matrix; however, situations may arise where data limitations must be assessed based on the reviewer's professional judgement.

#### Summary of Method

To ensure a thorough evaluation of each result in a data case, the reviewer must complete the checklist within this SOP, answering specific questions while performing the prescribed "ACTIONS" in each section. Qualifiers (or flags) are applied to questionable or unusable results as instructed. The data qualifiers discussed in this document are defined on page 5.

The reviewer must prepare a detailed data assessment to be submitted along with the completed SOP checklist. The Data Assessment must list all data qualifications, reasons for qualifications, instances of missing data and contract non-compliance.

### Reviewer Qualifications

Data reviewers must possess a working knowledge of SW846 Analytical Methods and National Functional Guidelines mentioned above.

- 3 -

YES NO N/A

#### **DEFINITIONS**

#### Acronyms

BNA - base neutral acid(another name for Semi Volatiles)

CLP - Contract Laboratory Program

CRQL - Contract Required Quantitation Limit

%D - percent difference

DCB -decachlorobiphenyl

DDD - dichlorodiphenyldichloroethane

DDE - dichlorodiphenylethane

DDT - dichlorodiphenyltrichloroethane

DoC - Date of Collection

GC - gas chromatography

GC/ECD - gas chromatograph/electron capture detector

GC/MS - gas chromatograph/mass spectrometer

GPC - gel permeation chromatography

IS - internal standard

kq - kilogram

μq - microgram

MS - matrix spike

MSD - matrix spike duplicate

ℓ - liter

ml - milliliter

PCB - Polychlorinated biphenyl

PE - performance evaluation

PEM - Performance Evaluation Mixture

QC - quality control

RAS - Routine Analytical Services

RIC - reconstructed ion chromatogram

RPD - relative percent difference

RRF - relative response factor

RRF - average relative response factor (from initial calibration)

RRT - relative retention time

RSD - relative standard deviation

RT - retention time

RSCC - Regional Sample Control Center

SDG - sample delivery group

SMC - system monitoring compound

SOP - standard operating procedure

SOW - Statement of Work

SVOA - semivolatile organic acid

TCL - Target Compound List

TCLP - Toxicity Characteristics Leachate Procedure

- 4 -

> YES NO N/A

TCX -tetrachloro-m-xylene

TIC - tentatively identified compound

TOPO - Task Order Project Officer

TPO - Technical Project Officer

VOA - Volatile organic

VTSR - Validated Time of Sample Receipt

#### Data Qualifiers

- The analyte was analyzed for, but was not detected above U the reported sample quantitation limit.
- The analyte was positively identified; the associated J numerical value is the approximate concentration of the analyte in the sample.
- The analysis indicates the presence of an analyte for which N there is presumptive evidence to make a "tentative identification."
- The analysis indicates the presence of an analyte that has JN been "tentatively identified" and the associated numerical value represents its approximate concentration.
- The analyte was not detected above the reported sample UJ quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- The sample results are rejected due to serious R deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

#### LAB QUALIFIERS:

- The positive value is the result of an analysis at a D secondary dilution factor.
- The analyte is present in the associated method blank as В well as in the sample. This qualifier has a different meaning when validating inorganic data.

- 5 -

YES NO N/A

	E -	The concentration of this analyte exceeds the calibration							
	L	range of the instrument.							
	Α -	Indicates a Tentatively Identified Compound (TIC) is a suspected adol-condensation product.							
	X,Y,Z-	Laboratory defined flags. The data reviewer must change these qualifiers during validation so that the data user may understand their impact on the data.							
I.		PACKAGE COMPLETENESS AND DELIVERABLES							
CASE	NUMBER:	LAB:							
SITE	NAME:								
1.0	Data Completeness and Deliverables								
	1. The state of the submitted in CLP deliverable []								
	ACTION:	If not, note the effect on review of the data in the data assessment narrative.							
2.0	Cover Lett	ter, SDG Narrative							
	2.1 Is a	laboratory narrative or cover letter present?[]							
		case number and SDG number(s) contained in the or cover letter?							
II.		SEMIVOLATILE ANALYSES							
1.0	Traffic Re	eports and Laboratory Narrative							
	1.1 Are t samples?	the Traffic Report Forms present for all							

ACTION: If no, contact lab for replacement of missing or illegible copies.

YES NO N/A

<u>[ ]</u>

1.2	Do the Traffic Reports or Lab Narrative indicate any		
	problems with sample receipt, condition of samples,		
	analytical problems or special notations affecting		
	the quality of the data?	[ ]	

ACTION: If any sample analyzed as a soil, other than TCLP, contains 50%-90% water, all data should be flagged as estimated ("J"). If a soil sample, other than TCLP, contains more than 90% water, all non-detects data are qualified as unusable (R), and detects are flagged "J".

ACTION: If samples were not iced, or if the ice was melted upon arrival at the laboratory and the cooler temperature was elevated (10°C), flag all positive results "J" and all non-detects "UJ".

# 2.0 Holding Times

2.1 Have any semivolatile technical holding times, determined from date of collection to date of extraction, been exceeded?

Continuous extraction of water samples for semivolatile analysis must be started within 7 days of the date of collection. Soil/sediment samples must be extracted within 14 days of collection. Extracts must be analyzed within 40 days of the date of extraction.

### Table of Holding Time Violations

(See Traffic Report)

Sample Sample Date Date Lab Date Date

3.2 If so, are <u>all the samples listed</u> on the appropriate Surrogate Recovery Summary forms for each matrix:

USEPA Region II SW846 Method 8270D (Rev.4, January 1998)

Date: December 2010
P HW-22 Rev.5

YES NO N/A

	a.	Low Water	[]		
	b.	Low/Med Soil	[]		
ACTIC	N:	If CLP deliverables are unavailable, document the effect(s) in data assessments. In some cases the lab may have to be contacted to obtain the data necessary to complete the validation.	า		
3.3	Were	outliers marked correctly with an asterisk?	[]		
	ACTIO	ON: Circle all outliers in red.		•	
3.4	recover from page	two or more base neutral <u>OR</u> acid surrogate veries out of specification for any sample or od blank (Reviewer should use lab in house very limits. Use surrogate recovery limits USEPA National Functional Guidlines January 2 130, if in house limits are not available. Method 8000B-43 or 80000C-24).	2005 []		
	Note:	Examine lab in house limits for reasonal	olenes	BS.	
	-	es, were samples re-analyzed? method blanks re-analyzed?	[]		_

ACTION: If all surrogate recoveries are > 10% but two within the base-neutral or acid fraction do not meet method specifications, for the affected fraction only (i.e. either base-neutral or acid compounds):

- Flag all positive results as estimated ("J").
- 2. Flag all non-detects as estimated detection limits ("UJ") when recoveries are less than the lower acceptance limit.

YES NO N/A

\_\_ [ ]

[ ]

3. If recoveries are greater than the upper acceptance limit, do not qualify non-detects.

If any base-neutral <u>or</u> acid surrogate has a recovery of < 10%:

- Positive results for the fraction with < 10% surrogate recovery are qualified with "J".
- Non-detects for that fraction should be qualified as unusable (R) .

NOTE: Professional judgement should be used to qualify data that have method blank surrogate recoveries out of specification in both original and reanalyses. Check the internal standard areas.

3.5 Are there any transcription/calculation errors between raw data and Form II?

ACTION: If large errors exist, call lab for explanation/resubmittal, make any necessary corrections and document effect in data assessments.

### 4.0 Matrix Spikes (Form III/Equivalent)

4.1 Have the semivolatile Matrix Spike and
Matrix Spike Duplicate/or duplicate unspiked
Sample recoveries been listed on the
Recovery Form (Form III)?

NOTE: Method 3500B/page 4 states the spiking compounds:

Base/neutrals

1,2,4-Trichlorobenzene Pentachlorophenol

Acenaphthene Phenol

2,4-Dinitrotoluene 2-Chlorophenol

Pyrene 4-Chloro-3-methylphenol

Acids

N-Nitroso-di-n-propylamine 4-Nitrophenol

YES NO N/A

1,4-Dichlorobenzene

Note:

Some projects may require the spiking of specific compounds of interest.

Note:

See Method 8270D-sec 8.4.2 for deciding on whether to prepare and analyze duplicate samples or a martix spike/matrix spike duplicate. If samples are expected to contain target analytes, then laboratory may use one matrix spike and a duplicate analysis of an unspiked field sample. If samples are not expected to contain target analytes, laboratory should use a matrix spike and matrix spike duplicate pair.

4.2 Were matrix spikes analyzed at the required frequency for each of the following matrices:

a.	Low Water	[]
b.	Low Solid	
c.	Med Solid	r 1

ACTION:

If any matrix spike data are missing, take the action specified in 3.2 above. It may be necessary to contact the lab to obtain the required data.

NOTE:

If the data has not been reported on CLP equivalent form, then the laboratory must provide the information necessary to evaluate the spike recoveries in the MS and MSD. The required data which should have been provided by the lab include the analytes and concentrations used for spiking, background concentrations of the spiked analytes (i.e., concentrations in unspiked sample), methods and equations used to calculate the QC acceptance criteria for the spiked analytes, percent recovery data for all spiked analytes.

YES NO N/A

The data reviewer must verify that all reported equations and percent recoveries are correct before proceeding to the next section.

4.3	equal	matrix spikes performed at control to 100 mg/L for acid compound base compounds (Method 3500B-4 fied in project plan.	s, and 200ug/l	[]

## 6.0 Contamination

ACTION:

NOTE: "Water blanks", "drill blanks" and "distilled water blanks" are validated like any other sample and are not used to qualify the data. Do

effect on the data.

Use professional judgement to determine the

YES NO N/A

not confuse them with the other QC blanks discussed below.

	positive results for target analytes and/or TICs? When applied as described below, the contaminant	•		
	concentration in these blanks are multiplied by			
	the sample dilution factor and corrected for			
	percent moisture where necessary.	<del></del>	1	
6.2	Do any field/rinse/ blanks have positive results for targe and/or TICs (if required,			
	∴ ∴ ∴ ∴ ⊃elow)?		[]	

ACTION: Preser a list of the samples associated te contaminated blanks.

(Attach a separate sheet.)

6.1 Do any method/instrument/reagent blanks have

NOTE: All field blank results associated to a particular group of samples (may exceed one per case) must be used to qualify data. Blanks may not be qualified because of contamination in another blank. Field Blanks must be qualified for outlying surrogates, poor spectra, instrument performance or calibration QC problems.

ACTION: Follow the directions in the table below to qualify sample results due to contamination.

Use the largest value from all the associated blanks. If gross contamination exists, all data in the associated samples should be qualified as unusable (R).

YES NO N/A

# **Blank Action for Semivolatile Analyses**

Blank Type	Blank Result	Sample Result	Action for Samples
	Detects	Not detected	No qualification required
	< CRQL *	< CRQL	Report CRQL value with a U

ACTION:	Add "JN" qualifier only to analytes identified by CAS #.	ed				
as :	10.3 Are any target compounds from one fraction listed as TIC compounds in another (e.g., an acid compound listed as a base neutral TIC)?					
ACTION:	i. Flag with "R" any target compound liste as a TIC.	ed				
	ii. Make sure all rejected compounds are properly reported in the other fraction	1.				
spec 10%	all ions present in the reference mass ctrum with a relative intensity greater than (of the most abundant ion) also present in the ple mass spectrum?	ne []				

YES NO N/A

	int	ensi	ities	agree	withir	ı ±	20%?			[ ]	
10.5	Do	TIC	and	"best	match"	sta	andard	relative	ion		

ACTION: Use professional judgement to determine acceptability of TIC identifications. If it is determined that an incorrect identification was made, change the identification to "unknown" or to some less specific identification (example: "C3 substituted benzene") as appropriate and remove "JN". Also, when a compound is not found in any blank, but is a suspected artifact of a common laboratory contaminant, the result should be qualified as unusable, "R."

## 11.0 Compound Quantitation and Reported Detection Limits

11.1 Are there any transcription/calculation errors in

Form I results? Check at least two positive values.

Verify that the correct internal standard,

Tation ion, and RRF were used to calculate

Form I result. Were any errors found?

[]

NOTE: Structural isomers with similar mass spectra, out insufficient GC resolution (i.e. percent valley between the two peaks > 25%) should be reported as isomeric pairs. The reviewer should check the raw data to ensure that all such isomers were included in the quantitation (i.e., add the areas of the two coeluting peaks to calculate the total concentration).

11.2 Are the method detection limits adjusted to reflect sample dilutions and, for soils, sample moisture?

[]

ACTION: If errors are large, call lab for explanation/resubmittal, make any necessary corrections and document effect in data assessments.

YES NO N/A

ACTION: When a sample is analyzed at more than one dilution, the lowest detection limits are used (unless a QC exceedance dictates the use of the higher detection limit from the diluted sample data). Replace concentrations that exceed the calibration range in the original analysis by crossing out the "E" and it's associated value on the original Form I (if present) and substituting the data from the analysis of the diluted sample. Specify which Form I is to be used, then draw a red "X" across the entire page of all Form I's that should not be used, including any in the summary package.

### 12.0 Standards Data (GC/MS)

12.1 Are the	Reconstructed Ion Chromatograms, and data		
system	printouts (Quant, Reports) present for		
initial	and continuing calibration?	[ ]	 
ACTION: If	any calibration standard data are missing,		
ta	ake action specified in 3.2 above.		

# 13.0 GC/MS Initial Calibration (Form VI/Equivalent)

13.1 Is the Initial Calibration Form (Form VI/
Equivalent) present and complete for the
semivolatile fraction?

[]

ACTION: If any calibration forms or standard row data are missing, take action specified in 3.2 above.

13.2 Are all base neutral or acid RRFs > 0.050?

Check the average RRFs of the four System

Performance Check Compounds (SPCCs):

N-nitroso-di-n-propylamine, hexachlorocyclopentadiene,

2,4-dinitrophenol, and 4-nitrophenol. These

compounds must have average RRFs greater than or

equal to 0.05 before running samples and should not

YES NO N/A

show any peak tailing.

ACTION: Circle all outliers in red.

ACTION: For any target analyte with average RRF <0.05

- 1. "R" all non-detects;
- 2. "J" all positive results.
- 13.3 Are response factors for base neutral or acid target analytes stable over the concentration range of the calibration (% Relative standard deviation [%RSD] < 20.0%)?

[] \_\_\_\_

NOTE: The % RSD for each individual Calibration Check Compound (CCC, Method 8270D-40 see Table 4) must be less than 30% before analysis can begin. If grater 30%, the lab must clean and recalibrate the instrument.

#### CALIBRATION CHECK COMPOUNDS

Base/Neutral Fraction	Acid Fraction
Acenaphthene	4-Chloro-3-methylphenol
1,4-Dichlorobenzene	2,4-Dichlorophenol
Hexachlorobutadiene	2-Nitrophenol
Diphenylamine	Phenol
Di-n-octyl phthalate	Pentachlorophenol
Fluoranthene	2,4,6-Trichlorophenol
Benzo(a)pyrene	

ACTION: If the %RSD for any CCC >30% and no corrective action taken, then "J" qualify all positive hits and "UJ" qualify all non-detects.

ACTION: Circle all outliers in red.

ACTION: If the % RSD is > 20.0%, qualify positive

YES NO N/A

[ ]

results for that analyte "J" and non-detects using professional judgement. When RSD > 90%, flag all non- detect results for that analyte "R," unusable. Alternatively, the lab should calculate first or second order regression fit of the calibration curve and select the fit which introduces the least amount of error.

NOTE: Analytes previously qualified "U" due to blank contamination are still considered as "hits" when qualifying for calibration criteria.

- 13.4 Did the laboratory calculate the calibration curve by the least squares regression fit?
- 13.5 Are there any transcription/calculation errors in the reporting of average response factors (RRF) or % RSD? (Check at least two values but if errors are found, check more.)

ACTION: Circle Errors in red.

ACTION: If errors are large, call lab for explanation/ resubmittal, make any necessary corrections and note errors in data assessments.

- 13.5 Do the target compounds for this SDG include Pesticides?

ACTION: If DDT percent breakdown exceeds 20%:

i. Qualify all positive results for DDT with "J". If DDT was not detected, but DDD and DDE results are positive, qualify the quantitation limit for DDT as unusable, "R".

YES NO N/A

ii. Qualify all positive results for DDD and DDE as presumptively present at an approximate concentration "JN".

14.0	GC/MS Ca	libration Verification (Form VII/Equivalent)			
	14.1 Are pres	[]			
	anal	a calibration verification standard been yzed for every twelve hours of sample ysis per instrument?	[ ]		
	ACTION:	List below all sample analyses that were not within twelve hours of a calibration verification analysis for each instrument used	•		
	ACTION:	If any forms are missing or no calibration verification standard has been analyzed within twelve hours of every sample analysis, call lab for explanation/resubmittal. If continuing calibration data are not available, flag all associated sample data as unusable ("R").			
	If Y did	ny of the SPCCs have an RRF <0.05? ES, make a note in data assessment if the lab not take corrective action specified in section 4, page 8270D-18.		<u>[]</u>	
		ny of the CCCs have a %D between the initial continuing RRF which exceeds 20.0%?			

ACTION: If yes, make a note in data assessment.

15.0

Date: December 2010 P HW-22 Rev.5

YES NO N/A

(왕 ]	any semivolatile compounds have a % Difference D) between the initial and continuing RRF which eeds 20.0%?		[]	
ACTION:	Circle all outliers in red.			
ACTION:	Qualify both positive results and non-detects for the outlier compound(s) as estimated (J). When %D is above 90%, qualify all non-detects for that analyte as "R", unusable.			
14.6 Do	any semivolatile compounds have a RRF < 0.05?		[]	
ACTION:	Circle all outliers in red.			
14.7 Are the percon	If RRF < 0.05, qualify as unusable ("R") associated non-detects and "J" associated positive values.  there any transcription/calculation errors in reporting of average response factors (RRF) or cent difference (%D) between initial and tinuing RRFs? (Check at least two values but if ors are found, check more).		<u>[ ]</u>	
ACTION:	Circle errors in red.			
ACTION:	If errors are large, call lab for explanation/ resubmittal, make any necessary corrections and document effect(s) in the data assessments.			
<u>Interna</u>	l Standards (Form VIII)			
15.1 Are the internal standard areas (Form VIII) of every sample and blank within the upper and lower limits (-50% to + 100%) for each continuing calibration?				
ACTION:	List each outlying internal standard below.			

YES NO N/A

Sample ID	IS #	Area	LowerLimit	Upper Limit
		<del></del>	<del></del>	
	<del></del>		<del></del>	
			<del></del>	

(Attach additional sheets if necessary.)

Note: Check Table 5, 8270D-41 for associated analytes.

ACTION:

- i. If the internal standard area count is outside the upper or lower limit, flag with "J" all positive results and non-detects (U values) quantitated with this internal standard.
- ii. Non-detects associated with IS > 100% should not be qualified.
- iii. If the IS area is below the lower limit (<50%), qualify all associated non-detects (U-values) "J". If extremely low area counts are reported (<25%) or if performance exhibits a major abrupt drop off, flag all associated non-detects as unusable (R).
- 15.2 Are the retention times of all internal standards within 30 seconds of the associated calibration standard? [] \_\_\_\_

ACTION: Professional judgement should be used to qualify data if the retention times differ by more than 30 seconds.

YES NO N/A

16.0	Labor	atory	y Control Samples (LCS)		
	16.1		any LCS samples run in order to verify ytes which failed criteria for spike recovery?	<u>[]</u>	 
	16.2		the lab spike LCS sample spiked with the same ytes and the same concentrations as the matrix	( []	 
	with		the mean and standard deviation of all analytin the QC acceptance ranges as shown in Table D-43?		 
			If the recovery of any analyte falls out of the designated range, the analytical results for that compound is suspect and should be qualified "J" in the unspiked samples.		
17.0	Field	l Dupl	licates ·		
	17.1		any field duplicates submitted for volatile analysis?	[]	 
	ACTION:		Compare the reported results for field duplicates and calculate the relative percent difference.	:	
			Any gross variation between field duplicate results must be addressed in the reviewer narrative. However, if large differences exist, identification of field duplicates should be confirmed by contacting the sampler.
