TRI Pollution Prevention (P2) Search Tool

How to Find a Facility Implementing P2 Activities

This ***How To*** document describes one way to use the Toxics Release Inventory (TRI) Pollution Prevention (P2) Search Tool to identify facilities implementing source reduction activities. For this example, let's ask the question: *"Which facilities in my community implemented source reduction activities during the latest two reporting years?"*

1 **GO TO** the TRI P2 Search Tool query page https://www.epa.gov/enviro/facts/tri/p2.html

2 **ENTER** selection criteria

- Keep the "All Industry Sectors" and "All Chemicals" default to view all industries and chemicals reported.
- Select the latest two reporting years to view source reduction activities most recently implemented.
- Specify location information (State, City, or ZIP Code).

3 **CLICK** "Show P2 Activities" to see a list of facilities and their reported P2 activities

4 **FILTER** results for source reduction only. Go to P2 Text Filters dropdown and select "Only show information about source reduction activities." By default, the results are filtered to facilities reporting information related to source reduction AND other environmental practices.

5 **VIEW** a facility P2 Profile by clicking on the "P2 Details" button corresponding to the facility and chemical of interest.

6 **EXPLORE** the facility's P2 Profile for a chemical. The P2 Profile displays a waste management trend graph for the chemical, pie charts to compare facility waste management to the rest of the industry sector, and all P2 information the facility reported for that chemical.

7 **VIEW** the facility's P2 Profile for all chemicals. Go to the dropdown "Show P2 data for other chemicals at this facility." Select "Show all chemicals."

8 **GET** facility public contact information. At the top of the P2 profile, click the "TRI Facility profile" link to view facility contact name, phone number, or email.

For tips on industry comparative analysis, see the handout on How to Conduct an Industry Sector P2 Analysis.
