- Discussion Questions

# Methane Losses from Acid Gas Removal

---

- There are 291 acid gas removal (AGR) units in gas processing plants<sup>1</sup>
  - ◆ Emit 644 MMcf annually<sup>1</sup>
  - ◆ 6 Mcf/day emitted by average AGR unit<sup>1</sup>
  - ◆ Most AGR units use diethanol amine (DEA) process or Selexol™ process

<sup>1</sup>Inventory of U.S. Greenhouse Gas Emissions and Sinks 1990 - 2002

# What is the Problem?

---

- 1/3 of U.S. gas reserves contain CO<sub>2</sub> and/or N<sub>2</sub><sup>1</sup>
- Wellhead natural gas may contain acid gases
  - ◆ H<sub>2</sub>S, CO<sub>2</sub>, corrosive to gathering/boosting, transmission lines and distribution equipment
  - ◆ Off-spec pipeline quality gas
- Acid gas removal processes typically use DEA to absorb acid gas
- DEA regeneration strips acid gas (and absorbed methane)
  - ◆ CO<sub>2</sub> (with methane) is typically vented to the atmosphere
  - ◆ H<sub>2</sub>S is typically flared or sent to sulfur recovery

# Typical Amine Process

# Methane Recovery - New Acid Gas Removal Technologies

---

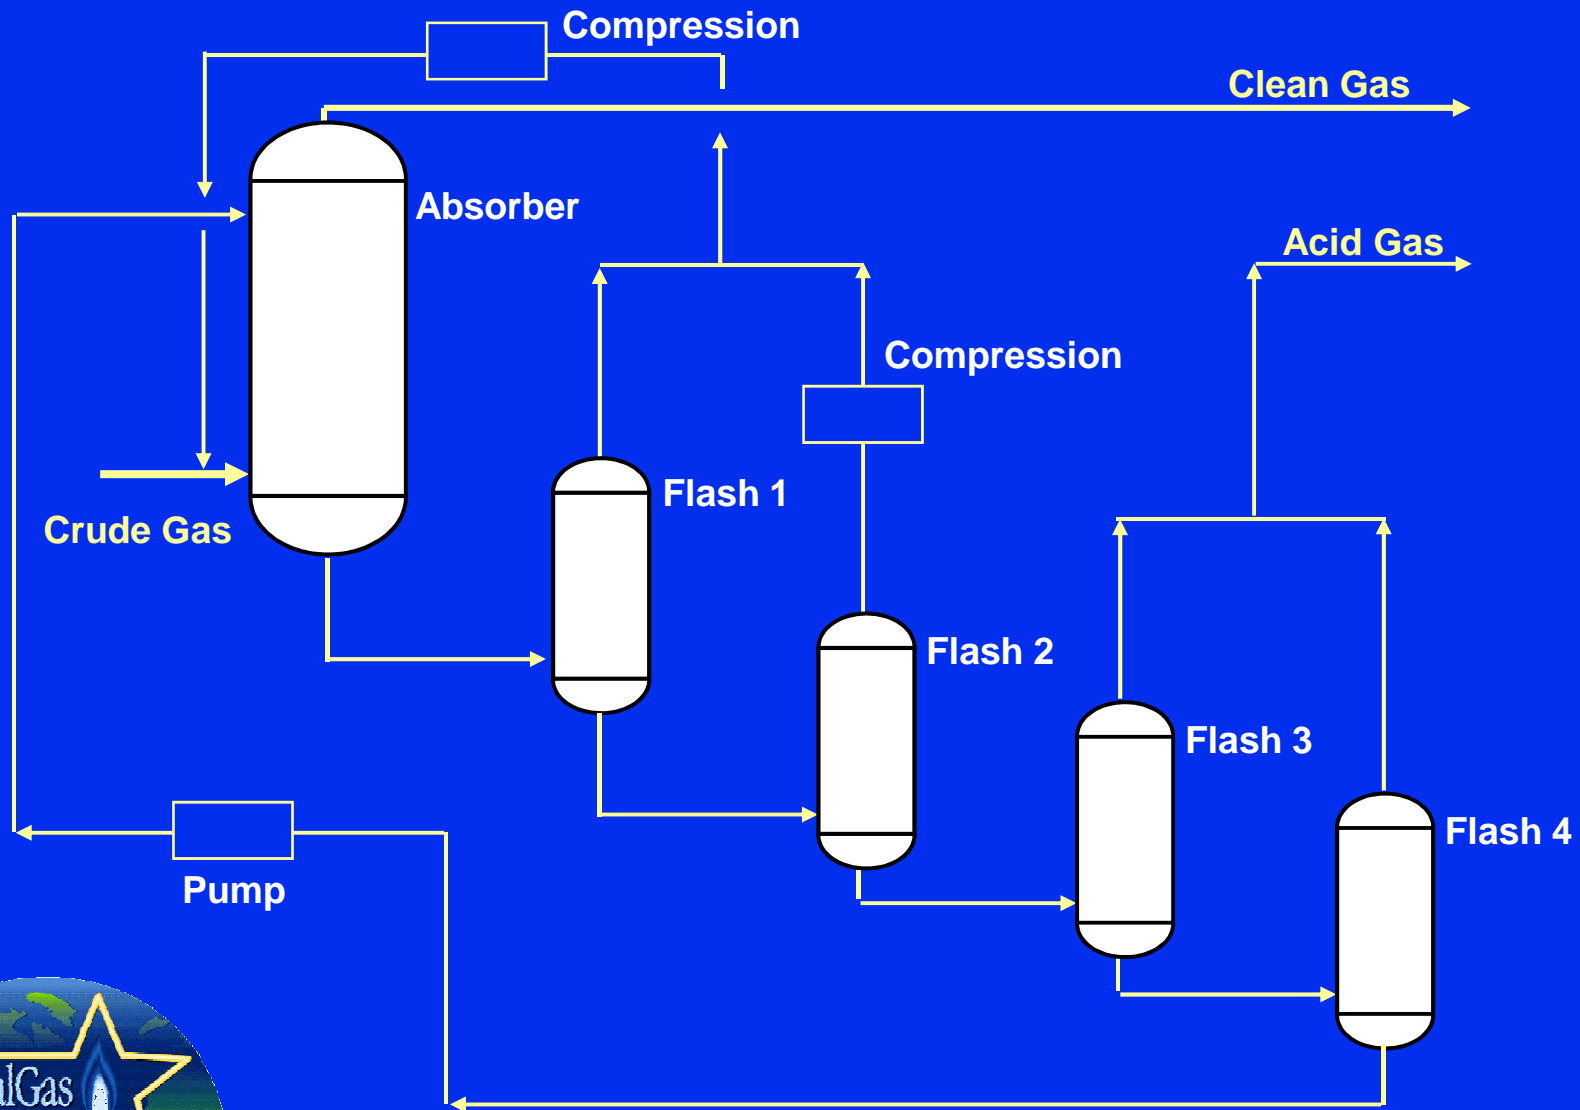

- GTI & Uhde Morphysorb<sup>®</sup> Process
- Engelhard Molecular Gate<sup>®</sup> Process
- Primary driver is process economics, not methane emissions savings
- Reduce methane venting by 50 to 100%

EPA POLLUTION PREVENTER

*Reducing Emissions, Increasing Efficiency, Maximizing Profits*

# Morphysorb<sup>®</sup> Process

*Reducing Emissions, Increasing Efficiency, Maximizing Profits*

# Morphysorb<sup>®</sup> Process

---

- Morphysorb<sup>®</sup> absorbs acid gas but also absorbs some methane
  - ◆ Methane absorbed is 66% to 75% lower than competing solvents<sup>1</sup>
- Flash vessels 1 & 2 recycled to absorber inlet to minimize methane losses
- Flash vessels 3 & 4 at lower pressure to remove acid gas and regenerate Morphysorb<sup>®</sup>

<sup>1</sup>Oil and Gas Journal, July 12, 2004, p57

# Is Recovery Profitable?

- ❑ Morphysorb<sup>®</sup> can process streams with high (>10%) acid gas composition
- ❑ 30% to 40% Morphysorb<sup>®</sup> operating cost advantage over DEA or Selexol<sup>™</sup> 2
  - ◆ 66% to 75% less methane absorbed than DEA or Selexol<sup>™</sup>
  - ◆ About 33% less THC absorbed<sup>2</sup>
  - ◆ Lower solvent circulation volumes
- ❑ At least 25% capital cost advantage from smaller contactor and recycles<sup>2</sup>
- ❑ Flash recycles 1 & 2 recover ~80% of methane that is absorbed<sup>1</sup>

<sup>1</sup>Oil and Gas Journal, July 12, 2004, p57, Fig. 7

# Industry Experience - Duke Energy

---

- Kwoen plant does not produce pipeline-spec gas
  - ◆ Separates acid gas and reinjects it in reservoir
  - ◆ Frees gathering and processing capacity further downstream
- Morpysorb<sup>®</sup> used in process unit designed for other solvent
- Morphysorb<sup>®</sup> chosen for acid gas selectivity over methane
  - ◆ Less recycle volumes; reduced compressor horsepower

EPA POLLUTION PREVENTER

*Reducing Emissions, Increasing Efficiency, Maximizing Profits*

# Methane Recovery - Molecular Gate<sup>®</sup> CO<sub>2</sub> Removal

- ❑ Adsorbs acid gas contaminants in fixed bed
- ❑ Molecular sieve application selectively adsorbs acid gas molecules of smaller diameter than methane
- ❑ Bed regenerated by depressuring
  - ◆ 5% to 10% of feed methane lost in “tail gas” depressuring
  - ◆ Route tail gas to fuel

# Molecular Gate<sup>®</sup> Applicability

## □ Lean gas

- ◆ Gas wells
- ◆ Coal bed methane

## □ Associated gas

### ◆ Tidelands Oil Production Co.

- 1 MMcf/d
- 18% to 40% CO<sub>2</sub>
- Water saturated

### ◆ Design options for C<sub>4</sub>+ in tail gas stream

- Heavy hydrocarbon recovery before Molecular Gate<sup>®</sup>
- Recover heavies from tail gas in absorber bed
- Use as fuel for process equipment

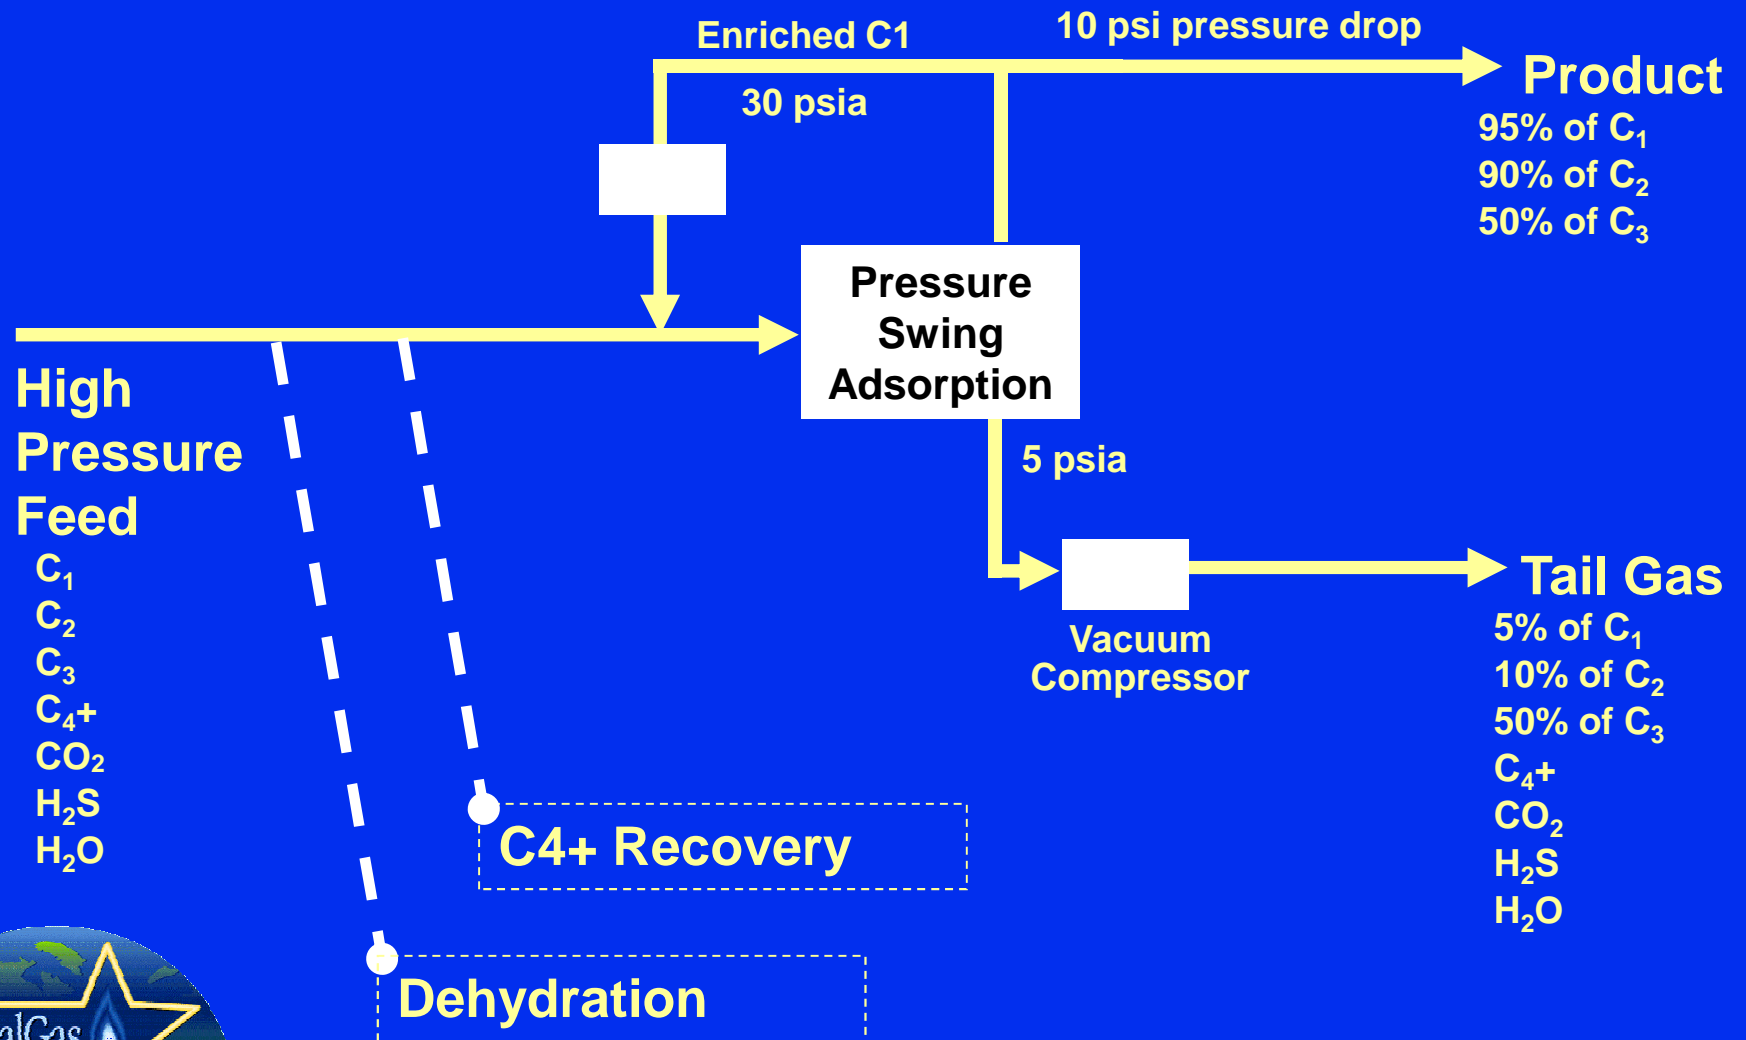

*Engelhard Molecular Gate system at a facility in Southern Illinois*

# Molecular Gate<sup>®</sup> CO<sub>2</sub> Removal

# Industry Experience - Tidelands Molecular Gate<sup>®</sup> Unit

- ❑ First commercial unit started on May 2002
- ❑ Process up to 10 MMcf/d
- ❑ Separate recycle compressor is required
- ❑ No glycol system is required
- ❑ Heavy HC removed with CO<sub>2</sub>
- ❑ Tail gas used for fuel is a key optimization: No process venting
- ❑ 18% to 40% CO<sub>2</sub> removed to pipeline specifications (2%)

***Reducing Emissions, Increasing Efficiency, Maximizing Profits***

# Is Recovery Profitable?

---

- Molecular Gate<sup>®</sup> costs are 20% less than amine process
  - ◆ 9 to 35 ¢ / Mcf product depending on scale
- Fixed-bed tail gas vent can be used as supplemental fuel
  - ◆ Eliminates venting from acid gas removal
- Other Benefits
  - ◆ Allows wells with high acid gas content to produce (alternative is shut-in)
  - ◆ Can dehydrate and remove acid gas to pipeline specs in one step
  - ◆ Less operator attention

# Comparison of AGR Alternatives

	<b>Amine Process</b>	<b>Morphysorb® Process</b>	<b>Molecular Gate® CO<sub>2</sub></b>
<b>Absorbent or Adsorbent</b>	<b>Water &amp; Amine</b>	<b>Morpholine Derivatives</b>	<b>Titanium Silicate</b>
<b>Regeneration</b>	<b>Reduce Pressure &amp; Heat</b>	<b>Reduce Pressure</b>	<b>Reduce Pressure to Vacuum</b>
<b>Primary Operating Costs</b>	<b>Amine &amp; Steam</b>	<b>Electricity</b>	<b>Electricity</b>
<b>Capital Cost</b>	<b>100%</b>	<b>75%</b>	<b>&lt;100%</b>
<b>Operating Cost</b>	<b>100%</b>	<b>60% – 70%</b>	<b>80%</b>

# Discussion Questions

---

- Have you studied either of these technologies?
- What are the barriers (technological, economic, lack of information, regulatory, focus, manpower, etc.) that are preventing you from implementing either of these technologies?
