Criteria emissions rounded to the nearest 1/100 of a ton, VOC/HAP rounded to 1/1000 of a ton.

EF AP-42<sup>1</sup> = emission factor from AP-42 Table 1.4-1, Small Boilers <100 MMbtu/hr (EPA 7/98), Standard = 1,020 Btu/scf

EF AP-42<sup>2</sup> = emission factor from AP-42 Table 1.4-2 (EPA 7/98)

EF AP-42<sup>3</sup> = emission factor from AP-42 Table 1.4-2 (EPA 7/98)

Fuel Consumption (MMscf/yr) = Heater Size (MBtu/hr) \* 1,000 (Btu/MBtu) \* Hours of Operation (hrs/yr)

Fuel Heat Value (Btu/scf) \* 1,000,000 (scf/MMscf) \* Heater Efficiency

NOx/CO/TOC Emissions (tons/yr) = AP-42 EF (lbs/MMscf) \* Fuel Consumption (MMscf/yr) \* (Fuel Heat Value/ Standard Fuel Heat Value) / 2,000 (lbs/ton) -Standard Fuel Heat Value, Natural Gas (AP-42, 7/98, p1.4-5) = 1,020 Btu/scf

VOC emissions assumed equal to TOC emissions

Project Setup Information 

 Project File
 : W:\EHS\Environmental\Air\Areas of Operation\Utah\\_MSO\RBU Dehy\Title V\EPA RBU Dehy :

 Flowsheet Selection
 : Oil Tank with Separator

 Calculation Method
 : RVP Distillation

 Control Efficiency
 : 0.00%

 Known Separator Stream
 : Low Pressure Oil

 Entering Air Composition : No : C10+ Component Group Filed Name : RBU 7-15E 400 BBL tank Well Name : Wasatch - Mesa Verde Representative Sample Well ID : PTE for Permit Date : 6/29/2017 \* Data Input Separator Pressure (psia) : 190.00 Separator Pressure (psia) : 190.( Separator Temperature (F) : 60.0 C10+ SG : 0.79 C10+ MW(lb/lbmol) : 140.24 -- Low Pressure Oil ------Mole% Wt% No. Component 0.0000 0.0000 0.0000 H2S 1 02 2 3 CO2 0.0140 0.0055 N2 0.0000 0.0000 1.2410 0.1771 4 5 C1 6 C2 1.1160 0.2986 C3 1.6120 0.6326 0.8900 0.4603 1.5600 0.8068 7 8 i-C4  $\begin{array}{ccccccc} 1.5600 & 0.8068 \\ 1.6000 & 1.0273 \\ 1.7030 & 1.0934 \\ 0.9670 & 0.7414 \\ 10.5110 & 9.3721 \\ 27.6200 & 28.0755 \\ 22.2340 & 25.3805 \\ 19.0540 & 23.7779 \\ 1.0330 & 0.7180 \\ 4.6820 & 3.8385 \\ 0.6270 & 0.5924 \\ 1.5670 & 1.4805 \\ 1.9220 & 1.4740 \end{array}$ n-C4 9 10 i-C5 n-C5 11 C6 12 13 C7 C8 14 15 C9 C10+ 16 Benzene 17 E-Benzene Xylenes n-C6 Toluene 18 19 20 21 1.9220 1.4740 22 224Trimethylp 0.0470 0.0478 -- Sales Oil -----Production Rate (bbl/day) : 6.00 Days of Annual Operation : 365 API Gravity : 55.91 Reid Vapor Pressure (psia) : 6.20 Ambient Pressure (psia) : 12.10 Ambient Temperature (F) : 60.0 \*\*\*\*\*\*\*\*\* Calculation Results -- Emission Summary -----Uncontrolled

## **MEMORANDUM**

- SUBJECT: Source Determination Analysis for River Bend Dehydrator Site
- FROM: Eric Wortman, Permit Engineer, EPA Region 8 Air Program

TO: XTO Energy – River Bend Dehydrator Site Initial Part 71 Permit File

The 8/2/16 revised definition of a major source at 40 CFR 71.2 (81 FR 35622) states that "For onshore activities belonging to Standard Industrial Classification (SIC) Major Group 13: Oil and Gas Extraction, pollutant emitting activities shall be considered adjacent if they are located on the same surface site; or if they are located on surface sites within a quarter mile of one another (measured from the center of the equipment on the surface site) and they share equipment." "Surface site" is given the same meaning as in 40 CFR 63.761, which defines a surface site as any combination of one or more graded pad sites, gravel pad sites, foundations, platforms, or the immediate physical location upon which equipment is physically affixed. "Shared equipment includes, but is not limited to, produced fluids storage tanks, phase separators, natural gas dehydrators or emissions control devices." The preamble explains that shared equipment generally means equipment "used to process or store the oil, natural gas or the byproducts of production." (see 81 FR 35624/2)

In the initial part 71 permit application for the River Bend Dehydrator Site, XTO Energy (XTO) included emissions from the RBU 6-15E, RBU 7-15E, and RBU 11-15E wellsites. The RBU 6-15E wellsite is located on the same gravel pad within the property boundaries of the River Bend Dehydrator facility and is part of the same "surface site" as defined in 63.761. The RBU 7-15E and RBU 11-15E wellsites are located within a quarter mile of the River Bend Dehydrator Site, but are not located on the same surface site. Emissions equipment at the three wellsites each consist of a condensate storage tank, fugitive emissions, truck loading emissions, and various natural gas-fired process heaters. The RBU 11-15E wellsite also operates a small < 2.0 MMscfd dehydration unit. Natural gas produced from the RBU 6-15E, RBU 7-15E and RBU 11-15E wellsites enters a common low-pressure gathering pipeline that flows to the Tap 1 Compressor Station (Tap 1 CS), and eventually back to the River Bend Dehydrator Site for further processing before entering the sales pipeline. (see Figure 1 below)

The Tap 1 CS is also located within a quarter mile of the River Bend Dehydrator Site, but is not located on the same surface site. The Tap 1 CS receives natural gas from nearby wells (including RBU 6-15E, RBU 7-15E, and RBU 11-15E wellsites) and compresses the gas up to a pressure where it can enter the XTO-operated high-pressure gas gathering pipeline. The emission units at Tap 1 CS include two natural gas-fired reciprocating internal combustion engines, two condensate storage tanks, heat trace pneumatic pumps, natural gas-fired heaters, condensate truck loading emissions, and fugitive emissions. The compressed natural gas from Tap 1 CS discharges directly into the River Bend Dehydrator Site, where the natural gas is dehydrated to meet pipeline specifications before entering the sales pipeline. Emissions equipment at the River Bend Dehydrator facility consists of a 45 MMscfd dehydration unit, two

condensate storage tanks, truck loading emissions, fugitive emissions, and various natural gas-fired process heaters.

All sites—the River Bend Dehydrator Site, the Tap 1 CS, and the RBU 6-15E, RBU 71-5E, and RBU 11-15E wellsites—have the same two-digit SIC code 13 and are under common control.

This source determination analysis uses the River Bend Dehydrator facility's surface site as the center site for the quarter-mile distance. (See 81 FR 35627/2-3; Response to Comments, Source Determination for Certain Emission Units in the Oil and Natural Gas Sector, at 71 "If there is any question remaining of which emitting activity should be the center point, such a determination is left to the discretion of the permitting authority.") In this case, because the River Bend Dehydrator facility was a new operation at the time of the permit application—and would thus need a title V permit regardless of any adjacent surface sites—it is reasonable to use the dehydrator facility as the center site.

Based on the information in the permit application and the definition of "surface site" in 40 CFR 63.761, the RBU 6-15E wellsite is located on the same surface site as the River Bend Dehydrator facility, but the RBU 7-15E wellsite, RBU 11-15E wellsite, and the Tap 1 CS are on three other, separate surface sites within a quarter-mile radius of the center site. Because the RBU 6-15E wellsite is on the same surface site as the center site, it is adjacent to the center site and thus part of the same major source as defined in part 71. The RBU 7-15E wellsite, RBU 11-15E wellsite, and Tap 1 CS share the equipment at the River Bend Dehydrator facility. For example, the 45 MMscfd dehydrator at River Bend is used to dehydrate the natural gas discharged from the Tap 1 CS, which includes gas produced from the RBU 7-15E and RBU 11-15E wellsites. Accordingly, pursuant to 40 CFR 71.2, the River Bend Dehydrator facility has "shared equipment" with the RBU 7-15E wellsite, RBU 11-15E wellsite, and the Tap 1 CS. Therefore, the emission units located at the RBU 7-15E wellsite, RBU 11-15E wellsite, and the Tap 1 CS are adjacent to the River Bend Dehydrator Site under the revised definition of a major source. Because activities at the RBU 7-15E wellsite, RBU 11-15E wellsite, and the Tap 1 CS also share the same two-digit SIC code and are under common control, they are thus considered part of the same major source as defined in part 71.

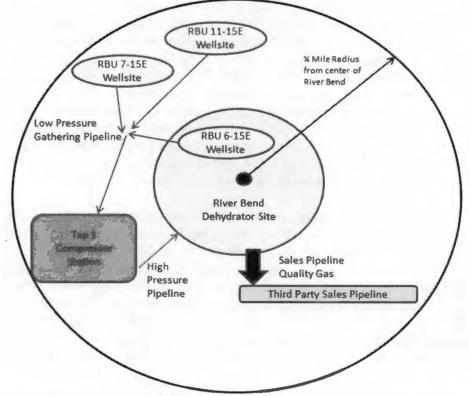

Figure 1. Flow Diagram of XTO Energy Natural Gas Production Operations – Uinta Basin, Utah River Bend Dehydration Site, RBU 6-15E Wellsite, RBU 7-15E Wellsite, RBU 11-15E Wellsite, Tap 1 Compressor Station

Eric:

Thanks for your response. My comments in RED:

- Note that you can take credit for the 95% reduction from MACT HH on RRBU D-1, so the controlled PTE in the Statement of Basis will be 14.6 tpy VOC and 10.9 tpy Total HAPs. Please refer to the attached, revised PTE table.
- With regard to your question on Title V applicability...after reviewing the updated PTE information, the controlled PTE for the aggregation of all sources is major for VOC and Total HAPs. This brings the site into Title V in addition to the major source status for HH. XTO is looking at permanently removing the dehy's at RBU 11-15E and RBU 7-15E, and can do so before the end of July of 2017. Since the dehy's are only used for 4 months or so during the winter, we can eliminate them at these locations by installing a solar powered methanol system instead of using the dehy's. This would get the facility VOC PTE below the 100 tpy limit, thereby eliminating the Title V applicability for uncontrolled VOC's and total HAP's. What are your comments on this modification?
- I disagree with your applicability that the small dehydrator at RBU 6-15E is an area source. According to §63.761, only HAP emissions from glycol dehydration units and storage vessels shall be aggregated for a major source determination at production field facilities. Since the RBU 6-15E wellsite is part of the same surface site as River Bend, emissions from dehydration unit RBU 6-15E D-1 and RBD-1 shall be aggregated to determine major source status. Therefore, dehydration unit RBU 6-15E D-1 is subject to the major source requirements of this subpart for small glycol dehydration units. The RBU 6-15E dehy system is currently not operating and will be permanently removed as of 7/31/2017. Therefore, XTO is removing this source from the application. Please let me know if you need anything else to support this revision.
- I'm also assuming that the operations at RBU 11-15E are similar to RBU 7-15E in that the gas is fed to a gathering flowline that eventually leads into Tap-1 CS. Let me know if I'm mistaken. Yes, you are correct.

In light of my comments, please let me know how we need to proceed with the RBU dehy Title V. Thanks.

Eric:

Thanks for the reply on the RBU Dehy TV. I wanted to have this formal response in order to answer any questions on why we have a Part 71 at RBU dehy.

Attached are the main two tables that we discussed that you will need to move forward on the draft permit. I will be following up next week with the other formal documents (EUD's, CTAC, supporting emissions calcs, etc.). Also, I will finish Tap-5 next week and get it to you as well. All of this will be coming the latter half of the week because I am out of the office until Wednesday, 7/5/2017.

Take a look at the attachments and let me know if you need any clarification on the information for RBU Dehy. Hopefully, this will help you get moving on the RBU Dehy draft. Thanks.

Subject: River Bend Dehy and Title V

Craig,

Per our discussion earlier on the phone, the dehydrator at the River Bend Dehydration Site is subject to the major source requirements of MACT HH because uncontrolled emissions exceed major HAP thresholds and there are no federally enforceable controls on the dehydration unit. Part 71 and MACT HH require major sources to obtain a title V permit

[see 40 CFR 63.760(h) and 40 CFR 71.3(a)]. The consent decree is not relevant because it expired/terminated in April of 2014. Because of the "Once In, Always In" policy, XTO cannot obtain a synthetic minor permit for the dehydrator at River Bend to avoid title V because the compliance date for MACT HH has already passed. EPA's "Once In, Always In" policy can be accessed at the following link: <u>https://www.epa.gov/sites/production/files/2015-08/documents/pteguid.pdf</u>.

Please note that this email is only provided to assist with your inquiry and is not an official determination of applicability to Federal air permitting requirements. If you would like more information or to proceed with a formal applicability determination, please let me know.

Eric

Eric:

Attached is the response to your information request. Also, XTO submitted a Tribal Registration in 2013 for the Tap-1 Compressor Station. The emissions that I sent for Tap-1 were an update to the tribal registration emission because the compressor engines were changed out in 2013 for a similar, lower horsepower model. The Tap-1 site is a true-minor site by itself.

Please let me know if you need anything else. I am working on the certified submittal and completing the Tap-5 information to hopefully be sent to you this Thursday. Thanks.

Regards, Craig Allison EH&S Advisor Environmental Health & Safety Office: 817-885-2672 | Cell: 817-201-2379 | Fax: 817-885-1847 XTO ENERGY INC., an ExxonMobil subsidiary 810 Houston Street, Fort Worth, Texas 76102

Subject: RE: Riverbend & Accompanying Wellsites

Eric – yes. I am working on it right now. You will have the below requested information today. As far as the timing for the certified submittal of Tap-5 and RBU Dehy requested information, I should be submitting the full packages by this Thursday.

Regards, Craig Allison EH&S Advisor Environmental Health & Safety Office: 817-885-2672 | Cell: 817-201-2379 | Fax: 817-885-1847 XTO ENERGY INC., an ExxonMobil subsidiary 810 Houston Street, Fort Worth, Texas 76102 From: Wortman, Eric [mailto:Wortman.Eric@epa.gov] Sent: Tuesday, March 14, 2017 11:55 AM To: Allison, Craig Subject: RE: Riverbend & Accompanying Wellsites

Craig,

Is it possible to send the info. requested below for Riverbend via email and the rest of the application update can come later if you need more time? Let me know your timeline on this, I may have to reschedule some things depending on if it's ready or not.

Eric

From: Wortman, Eric [mailto:Wortman.Eric@epa.gov] Sent: Wednesday, February 22, 2017 12:23 PM To: Allison, Craig Subject: FW: Riverbend & Accompanying Wellsites

Craig,

Following up to our phone conversation a couple weeks back, can you please confirm if Tap 1 Compressor Station is still operating and how far away it is from the Riverbend Dehy site? In the July 2011 response from XTO to our information request for multiple U&O facilities, XTO (then SGG) provided lat/long coordinates for the Tap 1 Compressor Station and the Riverbend Dehydration site. My preliminary analysis of those coordinates puts the Tap 1 CS at 0.19 miles from Riverbend Dehy. If Tap 1 is < ¼ mile from Riverbend Dehy, we need to evaluate the equipment operating at the sites to determine if Tap 1 and Riverbend have "shared" equipment and should be treated as one source under the revised definition of major source in part 71.

Please provide the following information by March 8th:

- The distance between Tap 1 Compressor Station and Riverbend Dehydration Site
- If the distance is < ¼ mile, please provide the following:

o A list of equipment operating at Tap 1 CS

- o The PTE for the equipment operating at Tap 1 CS
- o If the two sites share equipment (i.e. what is the operational relationship between the sites).

Thanks,

Eric

From: Simpson, Dustin [mailto:Dustin Simpson@xtoenergy.com] Sent: Wednesday, December 21, 2016 5:29 PM To: Wortman, Eric <<u>Wortman.Eric@epa.gov</u>> Subject: RE: Riverbend & Accompanying Wellsites

Eric,

The gas does go to an off-site compressor and then returns to the dehy at the RBU dehy. The dehy could operate independently of either one of the specific wells but the wells could not operate independently of the dehy facility as the gas has to be dehydrated prior to sales.

Thanks,

**Dustin Simpson**

From: Wortman, Eric [mailto:Wortman.Eric@epa.gov] Sent: Wednesday, December 21, 2016 4:01 PM To: Simpson, Dustin Subject: Riverbend & Accompanying Wellsites

Hi Dustin,

I had a question regarding the two wellsites at the Riverbend facility with regard to the revised definition of a major source. Since RBU 6-15E is located on the same surface site as Riverbend Dehy, it is included as part of the same source. Similar to my questions on Little Canyon, I'm working on EPA's interpretation for the RBU 7-15E wellsite since it's located within a ¼ mile of Riverbend Dehy but not on the same surface site. The RBU 6-15E and 7-15E wellsites discharge gas into the common gathering pipeline and not directly to the Riverbend Dehydrator Site. My understanding from the application is that the gas then flows to an offsite compressor station for further processing. Does the gas eventually come back to Riverbend Dehy Site before going to market or can it go elsewhere? In other words is the operation of Riverbend Dehy site necessary for the RBU 7-15E wellsite to produce gas to market or can both sites operate independently of each other?

Thanks,

Eric

# XTO Uintah Basin Title V Applications – 2016 / 2017 EPA Information Request 3/8/2017

#### Riverbend Dehy EPA Questions:

- A. Following up to our phone conversation a couple weeks back, can you please confirm if Tap 1 Compressor Station is still operating and how far away it is from the Riverbend Dehy site? The RBU Dehy Site is approximately 0.19 miles (< ½ mile) from the Tap-1 Compressor Station. The Tap-1 Compressor Station is still in-service.
- B. In the July 2011 response from XTO to our information request for multiple U&O facilities, XTO (then SGG) provided lat/long coordinates for the Tap 1 Compressor Station and the Riverbend Dehydration site. My preliminary analysis of those coordinates puts the Tap 1 CS at 0.19 miles from Riverbend Dehy. If Tap 1 is < ¼ mile from Riverbend Dehy, we need to evaluate the equipment operating at the sites to determine if Tap 1 and Riverbend have "shared" equipment and should be treated as one source under the revised definition of major source in part 71. Based on the determination that the Tap-1 Compressor Station and the RBU Dehy site are within ¼ mile of each other, The Tap-1 Compressor Stations receives natural-gas production from nearby wells and serves to compress the produced gas up to a pressure whereby the gas can enter the XTO operated gas gathering system. The natural gas then goes into Gathering system plpeline segment that discharges directly into the RBU Dehy site. The Tap-1 Compressor Station and the RBU Dehy site do not "share" any surface equipment other than the connecting pipelines. The gas from Tap-1 becomes comingled with the other inlet gas streams from other production areas at the inlet (pipeline manifold) of the RBU Dehy site. The gas from the Tap-1 compressor station does require dehydration at the RBU Dehy site prior to being sold.</p>
- C. Please provide the following information by March 8<sup>th</sup>:
  - a. The distance between Tap 1 Compressor Station and Riverbend Dehydration Site
  - b. If the distance is < ¼ mile, please provide the following:
    - i. A list of equipment operating at Tap 1 CS See attached.
    - ii. The PTE for the equipment operating at Tap 1 CS See attached.
    - iii. If the two sites share equipment (i.e. what is the operational relationship between the sites). The Riverbend Dehy site receives the compressed gas from the Tap-1 Compressor Station to allow the gas to be dehydrated prior to sales.
- D. I had a question regarding the two wellsites at the Riverbend facility with regard to the revised definition of a major source. Since RBU 6-15E is located on the same surface site as Riverbend Dehy, it is included as part of the same source. Similar to my questions on Little Canyon, I'm working on EPA's interpretation for the RBU 7-15E wellsite since it's located within a ¼ mile of Riverbend Dehy but not on the same surface site.
  - a. The RBU 6-15E and 7-15E wellsites discharge gas into the common gathering pipeline then to Tap-1 Compressor Station and not directly to the Riverbend Dehydrator Site. That is correct.
  - b. My understanding from the application is that the gas then flows to an offsite compressor station for further processing. Yes, the gas flows from the wells into the common gathering system and then into the Tap-1 Compressor Station which is located within a ¼ mile of the River Bend Dehy site.
  - c. Does the gas eventually come back to Riverbend Dehy Site before going to market or can it go elsewhere? Yes, it eventually goes to RB dehy site through the discharge of the Tap-1 Compressor Station.
  - d. In other words is the operation of Riverbend Dehy site necessary for the RBU 7-15E wellsite to produce gas to market or can both sites operate independently of each other? The sites cannot operate separately in the sense that the wells require their gas to be compressed at Tap-1 which discharges directly to the Riverbend Dehy site. Therefore, they are tied together operationally.

#### CONDITIONS AND DEFINITIONS

CONDITIONS AND DEFINITIONS Engine rating obtained and presented in accordance with ISO 3046/1, adjusted for fuel, site altitude and site inlet air temperature. 100% rating at maximum inlet air temperature is the maximum engine capability for the specified fuel at site altitude and maximum site inlet air temperature. Maximum rating is the maximum capability at the specified aftercooler inlet temperature for the specified fuel at site altitude and reduced inlet air temperature. Lowest load point is the lowest continuous duty operating load allowed. No overload permitted at rating shown.

For notes information consult page three.

CONDITIONS AND DEFINITIONS Engine rating obtained and presented in accordance with ISO 3046/1, adjusted for fuel, site altitude and site inlet air temperature. 100% rating at maximum inlet air temperature is the maximum engine capability for the specified fuel at site altitude and maximum site inlet air temperature. Maximum rating is the maximum capability at the specified aftercooler inlet temperature for the specified fuel at site altitude and reduced inlet air temperature. Lowest load point is the lowest continuous duty operating load allowed. No overload permitted at rating shown.

For notes information consult page three.

Loading Losses (lbs/1,000 gal) =  $\frac{12.46*S*P*M}{T}$ 

(AP-42 Section 5.2, Equation 1)

Loading Emissions (tons/year) = Loading Losses (lbs/1,000 gal) \* Oil Sales (1,000 bbls/yr) \* (42 gal/bbl) 2,000 lbs/ton

Degrees R =

Degrees F + 460

#### **Tank Truck S Factors**

| Mode of Operation                   | S Factor |
|-------------------------------------|----------|
| Submerged loading of a clean tank   | 0.5      |
| Submerged loading-dedicated service | 0.6      |
| Submerged loading-vapor balance     | 1.00     |
| Splash Loading-clean tank           | 1.45     |
| Splash loading-normal service       | 1.45     |
| Splash loading-vapor balance        | 1.00     |

# Condensate Tank Emissions (F/W/B)

#### Company: XTO Energy Facility Name: TAP 1 Compressor Station Facility Location: Uintah County, Utah Description: Uncontrolled - Two (2) X 300 bbl vertical, fixed-roof storage tanks

# **Manzanares, Candice**

From: Sent: To: Subject: Simpson, Dustin <Dustin\_Simpson@xtoenergy.com> Wednesday, December 21, 2016 3:29 PM Wortman, Eric RE: Riverbend & Accompanying Wellsites

Eric,

The gas does go to an off-site compressor and then returns to the dehy at the RBU dehy. The dehy could operate independently of either one of the specific wells but the wells could not operate independently of the dehy facility as the gas has to be dehydrated prior to sales.

Thanks,

#### Dustin Simpson

Subject: Riverbend & Accompanying Wellsites

Hi Dustin,

I had a question regarding the two wellsites at the Riverbend facility with regard to the revised definition of a major source. Since RBU 6-15E is located on the same surface site as Riverbend Dehy, it is included as part of the same source. Similar to my questions on Little Canyon, I'm working on EPA's interpretation for the RBU 7-15E wellsite since it's located within a ¼ mile of Riverbend Dehy but not on the same surface site. The RBU 6-15E and 7-15E wellsites discharge gas into the common gathering pipeline and not directly to the Riverbend Dehydrator Site. My understanding from the application is that the gas then flows to an offsite compressor station for further processing. Does the gas eventually come back to Riverbend Dehy Site before going to market or can it go elsewhere? In other words is the operation of Riverbend Dehy site necessary for the RBU 7-15E wellsite to produce gas to market or can both sites operate independently of each other?

Thanks,

Eric

Mr. Eric Wortman Office of Partnership & Regulatory Assistance EPA Region 8 (AP-AR) 1595 Wynkoop Street Denver, CO 80202-1129

To Whom It May Concern:

XTO Energy, Inc. (XTO) respectfully submits an Alternative Designated Responsible Official for 40 CFR 71 and 40 CFR 63. XTO confirms that the individuals listed in the table below meet the definition of Responsible Official stated in 40 CFR 63.2 and 40 CFR 71.2.

| Designated Responsible Official            | Alternate Designated Responsible Official |
|--------------------------------------------|-------------------------------------------|
| Mr. Kenneth S. Rose                        | Timothy Hermann                           |
| Sr. Vice President of Midstream Operations | Manager of Midstream Operations           |
| 810 Houston Street                         | 810 Houston Street                        |
| Fort Worth, TX 76102                       | Fort Worth, TX 76102                      |
| 817-885-1623 - Office                      | 817-885-2584 - Office                     |
| RO Designation began 01/01/2012            | Alt. RO Designation begins 04/07/2014     |

As stated in 40 CFR 63.2 and 40 CFR 71.2, Responsible Official is considered the following for a corporation such as XTO:

- (1) For a corporation: A president, secretary, treasurer, or vice president of the corporation in charge of a principal business function, or any other person who performs similar policy or decisionmaking functions for the corporation, or a duly authorized representative of such person if the representative is responsible for the overall operation of one or more manufacturing, production, or operating facilities and either:
  - (i) The facilities employ more than 250 persons or have gross annual sales or expenditures exceeding \$25 million (in second quarter 1980 dollars);
  - (ii) The delegation of authority to such representative is approved in advance by the Administrator.

Should you have any questions, please feel free to contact me at 817-885-1249 or via e-mail at Rykki\_Tepe@xtoenergy.com.

Sincerely,

Rykki Tepe

fyi

From: Patefield, Scott Sent: Thursday, January 24, 2013 2:05 PM To: Tepe, Rykki Subject: Re: Uintah County, UT - Leak Detection and Monitoring

Hi Rykki,

As we discussed on the telephone, if a source is no longer considered an onshore natural gas processing plant, the LDAR requirements of 40CFR60, subpart KKK would no longer apply. The consent decree identifies the Kings Canyon, TAP-4 and TAP-5 Facilities as onshore natural gas processing facilities. If the equipment rendering any of these facilities as a natural gas processing plant is removed (in this case, the dew point skids) and there are no other processes at any given facility that would subject them to the natural gas processing plant requirements, then they would no longer be subject to the NSPS, subpart KKK.

The requirements of MACT HH, MACT ZZZZ and the Consent Decree are independent of a facility's applicability to NSPS KKK, so the requirements of each would still apply even if the facility is no longer subject to the requirements of NSPS KKK.

I hope this helps, please feel free to contact me if you have any further questions or comments.

Thanks,

Scott Patefield, Environmental Scientist Office of Enforcement, Compliance & Environmental Justice EPA Region 8 1595 Wynkoop Street (8ENF-AT) Denver, CO 80202-1129 Phone: (303) 312-6248 Email: patefield.scott@epa.gov

| Subject: | Uintah County, UT - Leak Detection and Monitoring |

Hi Scott: As mentioned in the phone call, I am trying to determine whether we can eliminate our Leak Detection Monitoring for our Uintah County Facilities. In an Oct.31, 2011 Semi-Annual LDAR Report it was noted in the cover letter that because we were no longer considered a gas processing plant we would no longer be submitting LDAR Reports. We have continued to perform the leak detection surveys, and would like to eliminate them if not required. However, before eliminating I would like to ensure we are meeting EPA's expectations and that you agree with us. My areas that I have been reviewing in which we previously had applicable leak detection standards are MACT HH, NSPS ZZZZ, and our Consent Decree. We currently perform leak detection at any compressor station in Uintah County, UT where we have a dehydration unit – which includes Riverbend Dehy, Wild Horse Bench, Tap 5, River bend 11-18F, and Riverbend 9-17E, and LCU – Compressor Stations. Could you possibly offer me guidance on how we should move forward, and ensure we're still in compliance?

Feel free to call me if you have questions. Thanks!

Rykki R. Tepe Environmental Engineer XTO Energy, Inc. 810 Houston Street, Fort Worth TX, 76102 Office: 817-885-1249 Cell: 817-253-2986 Fax:817-885-1847 Email: <u>Rykki\_Tepe@xtoenergy.com</u>

## Wortman, Eric

From: Sent: To: Subject: Simpson, Dustin <Dustin\_Simpson@xtoenergy.com> Wednesday, December 21, 2016 3:29 PM Wortman, Eric RE: Riverbend & Accompanying Wellsites

Eric,

The gas does go to an off-site compressor and then returns to the dehy at the RBU dehy. The dehy could operate independently of either one of the specific wells but the wells could not operate independently of the dehy facility as the gas has to be dehydrated prior to sales.

Thanks,

# Dustin Simpson

Subject: Riverbend & Accompanying Wellsites

Hi Dustin,

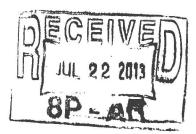

I had a question regarding the two wellsites at the Riverbend facility with regard to the revised definition of a major source. Since RBU 6-15E is located on the same surface site as Riverbend Dehy, it is included as part of the same source. Similar to my questions on Little Canyon, I'm working on EPA's interpretation for the RBU 7-15E wellsite since it's located within a ¼ mile of Riverbend Dehy but not on the same surface site. The RBU 6-15E and 7-15E wellsites discharge gas into the common gathering pipeline and not directly to the Riverbend Dehydrator Site. My understanding from the application is that the gas then flows to an offsite compressor station for further processing. Does the gas eventually come back to Riverbend Dehy Site before going to market or can it go elsewhere? In other words is the operation of Riverbend Dehy site necessary for the RBU 7-15E wellsite to produce gas to market or can both sites operate independently of each other?

Thanks,

Eric

#### RE: Change of Ownership – Title V Permits Previous Owner/Operator: Summit Gas Gathering, LLC New Owner/Operator: XTO Energy, Inc. Federal Tax ID 75-2347769

To Whom It May Concern:

Summit Gas Gathering, LLC has been dissolved and starting July 1, 2013, XTO Energy, Inc. assumed the role of owner/operator for Summit Gas Gathering, LLC. Kings Canyon Compressor Station was previously a Title V facility, and is currently registered as a True Minor NSR Registration (8/26/2010). Tap 4 Compressor Station was shut in and decommissioned (2/17/2012).

The following lists the active Title V facilities that require the change in owner/operator to XTO Energy, Inc.

- Little Canyon Unit Compressor Station
- River Bend Dehydration Site & Accompanying Well sites
- Tap 5 Compressor Station

If you have any questions or need any additional information to process these registration changes, please feel free to contact me at 817.885.1249 or by email at rykki\_tepe@xtoenergy.com.

Sincerely,

Klen Tepe

#### J. Facility Emissions Summary

Enter potential to emit (PTE) for the facility as a whole for each air pollutant listed below. Enter the name of the single HAP emitted in the greatest amount and its PTE. For all pollutants stipulations to major source status may be indicated by entering "major" in the space for PTE. Indicate the total actual emissions for fee purposes for the facility in the space provided. Applications for permit modifications need not include actual emissions information.

Responsible Official Notification of Change 40 CFR Part 71 and 40 CFR Part 63 Uintah County, UT

Via FedEx 2Day: 7932 4251 8563

Mr. Eric Wortman U.S. EPA Region 8 Office of Partnerships & Regulatory Assistance 1595 Wynkoop Denver, CO 80202

Dear Mr. Wortman:

Due to recent internal reorganization, Summit Gas Gathering, LLC (SGG), respectfully submits a Responsible Official Notification of Change for all sources in Uintah County, UT subject to 40 CFR 71 and 40 CFR 63. These sources include, but are not limited to, the following:

- Kings Canyon Unit Compressor Station 40 CFR 71 Permit # V-OU-0019-07.00
- TAP-4 Compressor Station 40 CFR 71 Permit # V-OU-0017-07.00
- TAP-5 Compressor Station 40 CFR 71 Permit # V-OU-0018-07.00
- Little Canyon Unit Compressor Station 40 CFR 71 Permit # Pending Issuance
- River Bend Dehydrator Site & Accompanying Wellsites 40 CFR 71 Permit # Pending Issuance

SGG confirms that the individuals listed in the table below meet the definition of Responsible Official stated in 40 CFR 63.2 and 40 CFR 71.2.

| Current Designated Responsible Official                       | New Designated Responsible Official      |  |
|---------------------------------------------------------------|------------------------------------------|--|
| Mr. Nick Dungey                                               | Mr. Kenneth S. Rose                      |  |
| Chairman of the Board and President                           | Vice President of Natural Gas Operations |  |

| RO Designation ends March 16, 2012 RO Designation begins Marc |                                          |  |

As stated in 40 CFR 63.2 and 40 CFR 71.2, Responsible Official is considered the following for a corporation such as SGG:

(1) For a corporation: A president, secretary, treasurer, or vice president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or a duly authorized representative of such person if the representative is responsible for the overall operation of one or more manufacturing, production, or operating facilities and either:

*(i)* The facilities employ more than 250 persons or have gross annual sales or expenditures exceeding \$25 million (in second quarter 1980 dollars); or

# Summit Gas Gathering, LLC 810 Houston Street

Ft. Worth, TX 76102-6298

(ii) The delegation of authority to such representative is approved in advance by the Administrator.

Attached is the completed CTAC form signed by the current designated Responsible Official for the operations of the Title V, 40 CFR Part 71 and 40 CFR Part 63 facilities referenced in this request.

Should you have any questions, please feel free to contact me at 817-885-2845 or via e-mail at Clare Hoang@xtoenergy.com.

Sincerely,

Clare Hoang **Environmental Engineer** XTO Energy Inc.

## INITIAL COMPLIANCE PLAN AND COMPLIANCE CERTIFICATION (I-COMP)

#### SECTION A - COMPLIANCE STATUS AND COMPLIANCE PLAN

Complete this section for each unique combination of applicable requirements and emissions units at the facility. List all compliance methods (monitoring, recordkeeping and reporting) you used to determine compliance with the applicable requirement described above. Indicate your compliance status at this time for this requirement and compliance methods and check "YES" or "NO" to the follow-up question.

Emission Unit ID(s): RBD-1

Applicable Requirement (Describe and Cite) MACT Subpart HH – Dehydration Controls

Compliance Methods for the Above (Description and Citation): Oil and Gas MACT (40 CFR 63, Subpart HH) – The glycol dehydration Unit has uncontrolled PTE for HAPs above the 10/25 TPY threshold. HAP emissions from emission unit RBD-1 will be reduced by greater than or equal to 95%.

Compliance Status:

| _X | In Compliance: | Will you continue to comply up to permit issuance? _ | _X | Yes |
|----|----------------|------------------------------------------------------|----|-----|
|    | No             |                                                      |    |     |

| Not In Compliance: | Will you be in | compliance at permit issuance? | Yes | No |
|--------------------|----------------|--------------------------------|-----|----|
|--------------------|----------------|--------------------------------|-----|----|

| Future-Effective Requirement | Do you expect to meet this on a timely | y basis?Yes | No |
|------------------------------|----------------------------------------|-------------|----|
|------------------------------|----------------------------------------|-------------|----|

Emission Unit ID(s):

Applicable Requirement (Description and Citation):

Compliance Methods for the Above (Description and Citation):

**Compliance Status:** 

| In Compliance: | Will you continue to | comply up to | permit issuance? | Yes | No |
|----------------|----------------------|--------------|------------------|-----|----|
|                |                      |              |                  |     |    |

| _ Not In Compliance: Will | you be in compliance at permit issuance? | Yes | No |
|---------------------------|------------------------------------------|-----|----|
|---------------------------|------------------------------------------|-----|----|

|-------------------------------|-----------------------------------------------|-----|----|
|-------------------------------|-----------------------------------------------|-----|----|

#### **B. SCHEDULE OF COMPLIANCE**

| Complete this section if you answered "NO" to any of the questions in section A. Also complete this |
|-----------------------------------------------------------------------------------------------------|
| section if required to submit a schedule of compliance by an applicable requirement. Please attach  |
| copies of any judicial consent decrees or administrative orders for this requirement.               |

Unit(s) N/A Requirement

Reason for Noncompliance. Briefly explain reason for noncompliance at time of permit issuance or that future-effective requirement will not be met on a timely basis:

Narrative Description of how Source Compliance Will be Achieved. Briefly explain your plan for achieving compliance:

Schedule of Compliance. Provide a schedule of remedial measures, including an enforceable sequence of actions with milestones, leading to compliance, including a date for final compliance.

| Remedial Measure or Action | Date to be<br>Achieved |
|----------------------------|------------------------|
|                            |                        |
|                            |                        |
|                            |                        |
|                            |                        |
|                            |                        |

#### C. SCHEDULE FOR SUBMISSION OF PROGRESS REPORTS

Only complete this section if you are required to submit one or more schedules of compliance in section B or if an applicable requirement requires submittal of a progress report. If a schedule of compliance is required, your progress report should start within 6 months of application submittal and subsequently, no less than every six months. One progress report may include information on multiple schedules of compliance.

## G. Source-Wide PTE Restrictions and Generic Applicable Requirements

Cite and describe any emissions-limiting requirements and/or facility-wide "generic" applicable requirements.

#### **H. Process Description**

List processes, products, and SIC codes for the facility.

| Process                               | Products    | SIC  |
|---------------------------------------|-------------|------|
| Natural Gas Production                | Natural Gas | 1311 |
|                                       |             |      |
|                                       |             |      |
| · · · · · · · · · · · · · · · · · · · |             |      |

#### I. Emission Unit Identification

Assign an emissions unit ID and describe each emissions unit at the facility. Control equipment and/or alternative operating scenarios associated with emissions units should by listed on a separate line. Applicants may exclude from this list any insignificant emissions units or activities.

| Emissions Unit ID | Description of Unit                                          |
|-------------------|--------------------------------------------------------------|
| RBL-1             | Condensate truck loading emissions                           |
| RBTO-1            | Thermal oxidizer emissions                                   |
| RBD-1             | 45 MMscfd Glycol dehydrator controlled by a thermal oxidizer |
| RBF-1             | Fugitive Emissions                                           |
| RBT-1             | One (1) 400-bbl slop tank #1                                 |
| RBT-2             | One (1) 400-bbl slop tank #2                                 |
| RBU 6-15E D-1     | 0.18 MMscfd Glycol dehydrator with a 4015 glycol pump        |
| RBU 6-15E F-1     | Fugitive Emissions                                           |
| RBU 7-15E D-1     | 0.10 MMscfd Glycol dehydrator with a 4015 glycol pump        |
| RBU 7-15E F-1     | Fugitive Emissions                                           |
|                   |                                                              |

#### J. Facility Emissions Summary

Enter potential to emit (PTE) for the facility as a whole for each air pollutant listed below. Enter the name of the single HAP emitted in the greatest amount and its PTE. For all pollutants stipulations to major source status may be indicated by entering "major" in the space for PTE. Indicate the total actual emissions for fee purposes for the facility in the space provided. Applications for permit modifications need not include actual emissions information.

| NOx1.       | 4 tons/yr          | VOC _204.0               | _ tons/yr    | SO2           | tons/yr      |

## E. VOC-containing Substance Data

List each VOC-containing substance consumed, processed or produced at the emissions unit that is emitted into the air. In the name column, if providing a brand name, include the name of the manufacture; if the substance contains HAP, list the constituent HAP.

OMB No. 2060-0336, Approval Expires 09/30/2010

Federal Operating Permit Program (40 CFR Part 71)

#### **INSIGNIFICANT EMISSIONS (IE) – River Bend 7-15E Wellsite**

List each insignificant activity or emission unit. In the "number" column, indicate the number of units in this category. Descriptions should be brief but unique. Indicate which emissions criterion of part 71 is the basis for the exemption.

| on.                                          | DAD    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# POTENTIAL TO EMIT (PTE)

For each unit with emissions that count towards applicability, list the emissions unit ID and the PTE for the air pollutants listed below and sum them up to show totals for the facility. You may find it helpful to complete form **EMISS** before completing this form. Show other pollutants not listed that are present in major amounts at the facility on attachment in a similar fashion. You may round values to the nearest tenth of a ton. Also report facility totals in section **J** of form **GIS**.

| Emissions Unit ID | Regulated Air Pollutants and Pollutants for which the Source is Major<br>(tons/yr) |        |     |      |     |      |      |
|-------------------|------------------------------------------------------------------------------------|--------|-----|------|-----|------|------|
|                   | NOx                                                                                | VOC    | SO2 | PM10 | со  | Lead | HAP  |

## **EMISSION CALCULATIONS (EMISS)**

Calculate potential to emit (PTE) for applicability purposes and actual emissions for fee purposes for each emissions unit, control device, or alternative operating scenario identified in section I of form **GIS**. If form **FEE** does not need to be submitted with the application, do not calculate actual emissions.

## A. Emissions Unit ID \_\_\_\_RBL-1\_\_\_\_\_

#### B. Identification and Quantification of Emissions

First, list each air pollutant that is either regulated at the unit or present in major amounts, then list any other regulated pollutant (for fee calculation) not already listed. HAP may be simply listed as "HAP." Next, calculate PTE for applicability purposes and actual emissions for fee purposes for each pollutant. Do not calculate PTE for air pollutants listed solely for fee purposes. Include all fugitives for fee purposes. You may round to the nearest tenth of a ton for yearly values or tenth of a pound for hourly values.

Federal Operating Permit Program (40 CFR Part 71)

## **EMISSION CALCULATIONS (EMISS)**

Calculate potential to emit (PTE) for applicability purposes and actual emissions for fee purposes for each emissions unit, control device, or alternative operating scenario identified in section I of form **GIS**. If form **FEE** does not need to be submitted with the application, do not calculate actual emissions.

## A. Emissions Unit ID \_\_\_RBD-1\_\_\_\_\_

## **EMISSION CALCULATIONS (EMISS)**

Calculate potential to emit (PTE) for applicability purposes and actual emissions for fee purposes for each emissions unit, control device, or alternative operating scenario identified in section I of form **GIS**. If form **FEE** does not need to be submitted with the application, do not calculate actual emissions.

A. Emissions Unit ID \_\_\_\_RBU 6-15E F-1\_\_\_\_\_

#### B. Identification and Quantification of Emissions

## **EMISSION CALCULATIONS (EMISS)**

Calculate potential to emit (PTE) for applicability purposes and actual emissions for fee purposes for each emissions unit, control device, or alternative operating scenario identified in section I of form **GIS**. If form **FEE** does not need to be submitted with the application, do not calculate actual emissions.

A. Emissions Unit ID \_\_\_\_RBU 7-15E F-1\_\_\_\_\_

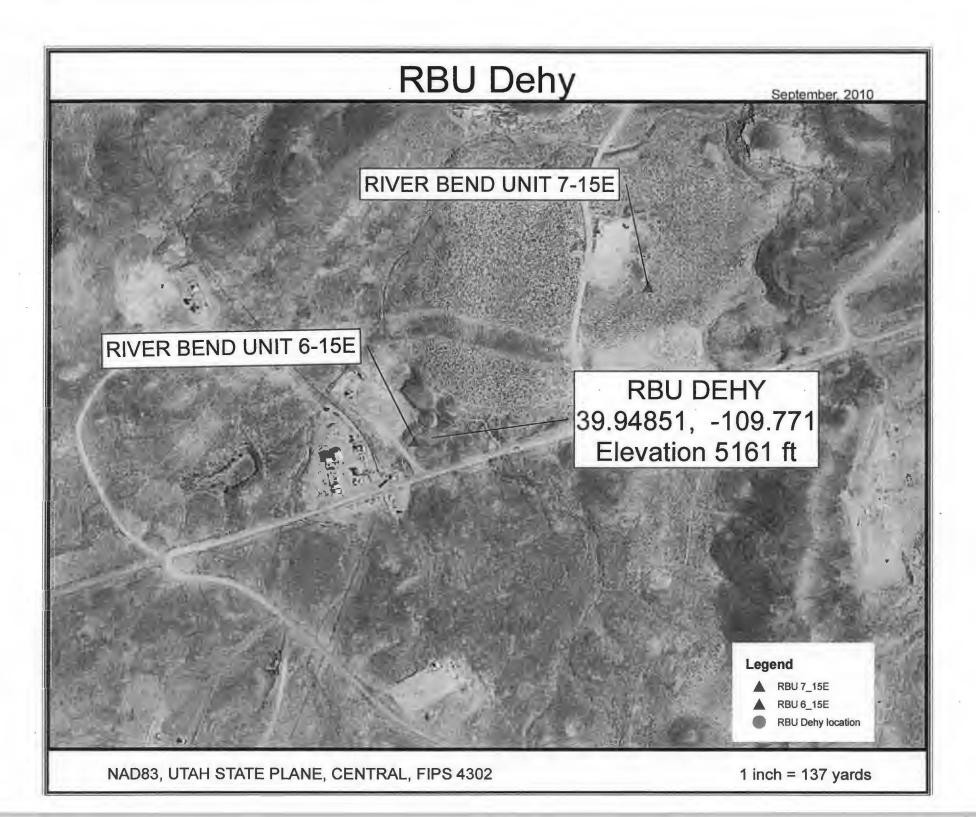

#### B. Identification and Quantification of Emissions

First, list each air pollutant that is either regulated at the unit or present in major amounts, then list any other regulated pollutant (for fee calculation) not already listed. HAP may be simply listed as "HAP." Next, calculate PTE for applicability purposes and actual emissions for fee purposes for each pollutant. Do not calculate PTE for air pollutants listed solely for fee purposes. Include all fugitives for fee purposes. You may round to the nearest tenth of a ton for yearly values or tenth of a pound for hourly values.

#### SGG River Bend Dehydrator Site & Accompanying Wellsite Process Description

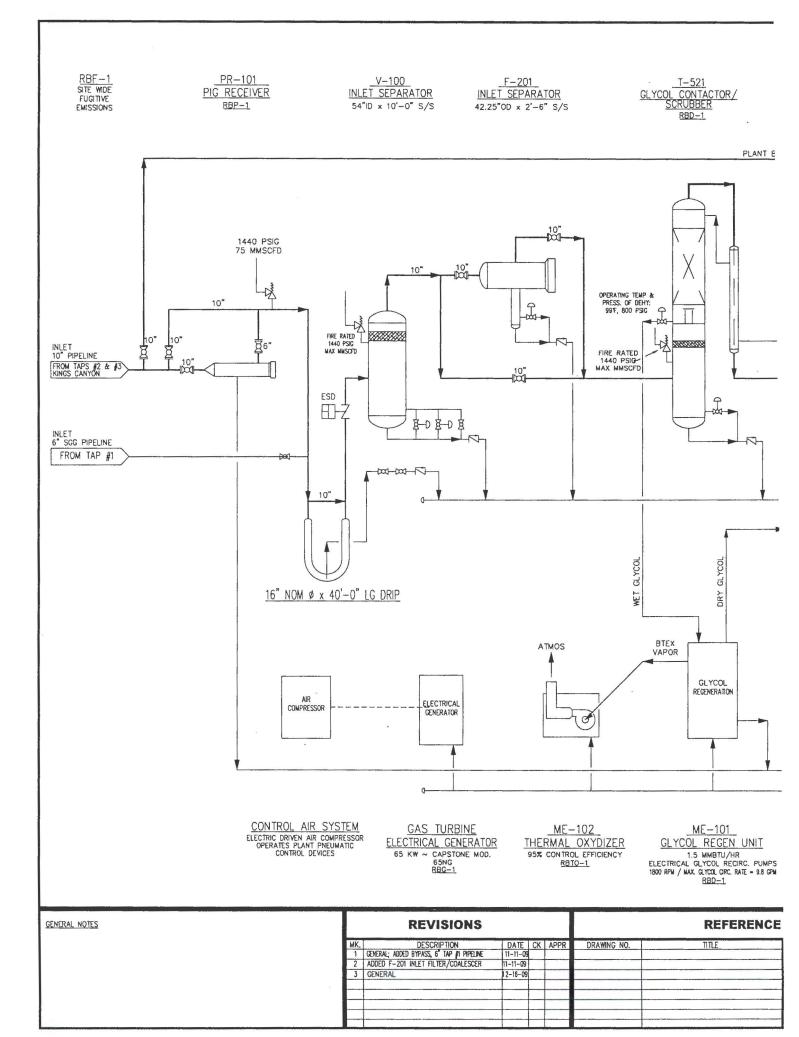

The River Bend Dehydrator Facility is a natural gas dehydrator consisting of the following equipment:

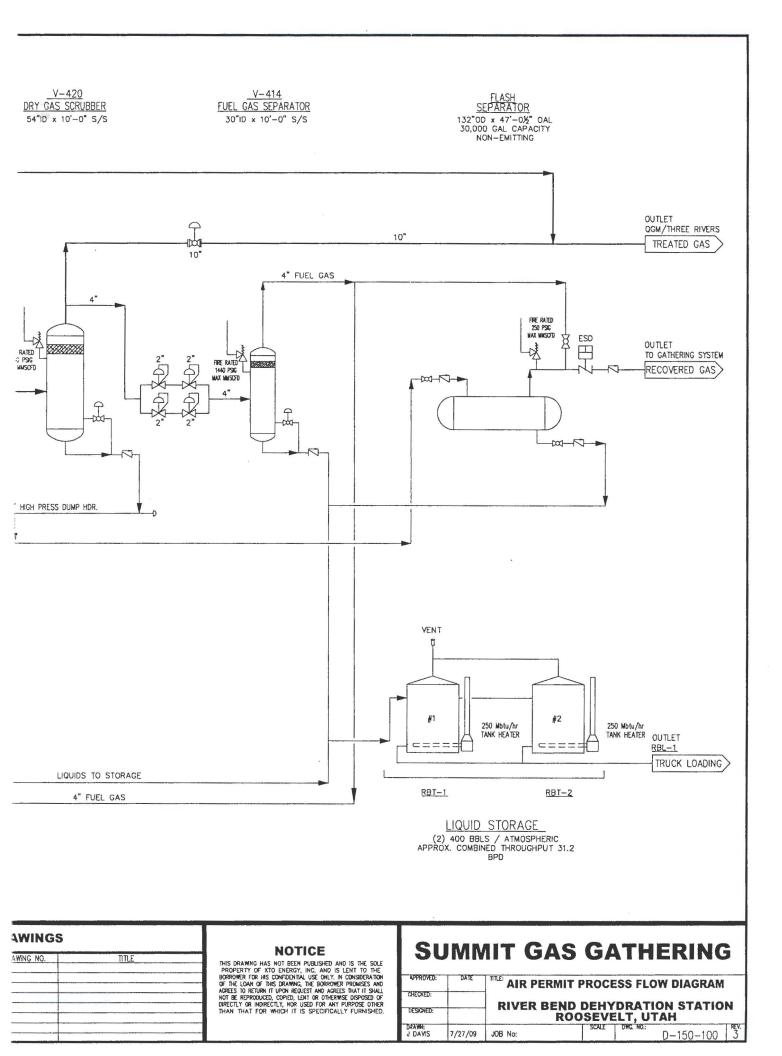

- Two (2) inlet two-phase gas scrubbers (separators) operating at an approximate line pressure of 1,000 psig.
- One (1) 65 KW Capstone natural-gas fired microturbine driven generator (RBG-1)
- One (1) air compressor used for controller operation
- Two (2) 400-barrel Water/Condensate-tanks (RBT-1 and RBT-2) each with a 0.25 mmBTU/hr tank heater,
- One (1) Horizontal Flash Separator consisting of a 30,000 gallon pressurized tank
- One (1) natural gas dehydrator with (RBD-1):
  - o A maximum natural gas process flow of 45 mmscfd natural gas, and
  - One (1) 1.5 mmBTU/hr TEG reboiler heater
  - One BTEX emissions control system consisting of a Thermal Oxidizer with a 3.0 mmBTU/hr burner.

The basic process flow at the facility is as follows:

Natural gas produced from area wells is compressed at existing offsite locations (Tap-1, 2, 3, and Kings Canyon) up to a line pressure of 850 to 1,000 psig and then sent to the River Bend natural gas dehydrator site through 6" and 10" gathering flowlines. Once the gas enters the station, it flows through two (2) two-phase separators (scrubbers) in order to reduce water and condensable liquids content in the gas stream. prior to entry into the dehydrator. The liquid produced from the on-site, inlet scrubbers is then sent to a 30,000-gallon pressurized flash separator. The purpose of the flash separator is to flash the high-pressured liquids and pipe the flash gas back to the highpressure gathering system, thereby eliminating the flash emissions from being vented to the atmosphere. The pressurized flash separator is then set to discharge the separated liquids at a pressure of approximately 50 psig into either of the onsite 400-barrel atmospheric liquid storage tanks (RBT-1 and RBT-2). The 400-barrel on-site liquid storage tanks (RBT-1 and RBT-2) are used for temporary storage prior to the liquids being hauled offsite by tanker truck (RBL-1). Following the inlet separation, the gas is discharged into the TEG natural gas dehydrator for further water removal from the natural-gas stream. The TEG natural gas dehydrator water removal system consists of one (1) 45 mmscfd (max rate) natural gas TEG dehydrator (RBD-1) with one (1) 1.5 mmBTU/hr TEG process heater with regenerator and flash tank emissions controlled by a Thermal Oxidizer. The natural gas dehydrator utilizes a BTEX emissions control system that captures vapors from the still vent and the flash tank and sends the vapors to a Thermal Oxidizer for destruction. Following dehydration the natural gas stream leaves the station via a metered sales pipeline. The station has on-site electrical power supplied by one (1) Capstone natural-gas fired microturbine-driven generator (RBG-1). In addition, the pneumatic control devices are operated by plant air supplied by the on-site electric-driven air compressor.

Other production equipment located near the River Bend Dehydrator facility consists of two production wellsites (RBU 6-15E and 7-15E) each with a small (less than 1.5 mmscfd max) dehydrator, one (1) 400-barrel storage tank, natural gas-fired heaters less than 0.4 mmBTU/hr at each site, and minimal fugitive and truck-loading emissions. The RBU 6-15E well is located within the property boundaries of the River Bend Dehydrator site, but the River Bend 7-15E wellsite is not located on property joining the locations. These wells do not discharge directly into the River Bend Dehydrator site and produce their gas into the common field gathering system and ultimately into off-site compressor stations. The gas discharged from the off-site compressor stations at Taps 1, 2, 3 and Kings Canyon enters the River Bend Dehydrator Site.

## POTENTIALLY APPLICABLE FEDERAL REGULATIONS

A breakdown of federal regulations will be discussed, including whether or not a rule is applicable and why or why not. Henceforth, the River Bend Dehy Site, including wellsites 6-15E and 7-15E, will be referred to as either the "Site" or the "Facility" throughout this document.

### 40 CFR 52 – PREVENTION OF SIGNIFICANT DETERIORATION

Section 52.21(a)(2) defines the "Applicability procedures" for this regulation. Specifically, it states that "The requirements of this section apply to the construction of any new major stationary source (as defined in paragraph (b)(1) of this section) or any project at an existing major stationary source in an area designated as attainment or unclassifiable under sections 107(d)(1)(A)(ii) or (iii) of the Act."

Paragraph (b)(1)(i) of Section 52.21 defines a major stationary source as "(a) Any of the following stationary sources of air pollutants which emits, or has the potential to emit, 100 tons per year or more of any regulated NSR pollutant: Fossil fuel-fired steam electric plants of more than 250 million British thermal units per hour heat input, coal cleaning plants (with thermal dryers), kraft pulp mills, portland cement plants, primary zinc smelters, iron and steel mill plants, primary aluminum ore reduction plants (with thermal dryers), primary copper smelters, municipal incinerators capable of charging more than 250 tons of refuse per day, hydrofluoric, sulfuric, and nitric acid plants, petroleum refineries, lime plants, phosphate rock processing plants, coke oven batteries, sulfur recovery plants, carbon black plants (furnace process), primary lead smelters, fuel conversion plants, sintering plants, secondary metal production plants, chemical process plants (which does not include ethanol production facilities that produce ethanol by natural fermentation included in NAICS codes 325193 or 312140), fossil-fuel boilers (or combinations thereof) totaling more than 250 million British thermal units per hour heat input, petroleum storage and transfer units with a total storage capacity exceeding 300,000 barrels, taconite ore processing plants, glass fiber processing plants, and charcoal production plants;

(b) Notwithstanding the stationary source size specified in paragraph (b)(1)(i) of this section, any stationary source which emits, or has the potential to emit, 250 tons per year or more of a regulated NSR pollutant; or

(c) Any physical change that would occur at a stationary source not otherwise qualifying under paragraph (b)(1) of this section, as a major stationary source, if the changes would constitute a major stationary source by itself.

The Facility does not meet the definition or qualifications of any of the stationary sources listed under Section 52.21(b)(1)(i)(a), including "petroleum storage and transfer units with a total storage capacity exceeding 300,000 barrels." The Facility has approximately 1,500 barrels of storage capacity onsite, including two neighboring wellsites.

The Facility does not meet the criteria listed under Section 52.21(b)(1)(i)(b) as it does not have the potential to emit 250 tons per or year or more of any regulated NSR pollutant. Please see enclosed potential to emit calculations for this Site.

Finally, the Facility does not meet the criteria listed under Section 52.21(b)(1)(i)(c) as it is a new source and has not made a physical change qualifying the source as a major stationary source by itself.

Therefore 40 CFR 52 does not apply to this Site.

#### 40 CFR 60 – STANDARDS OF PERFORMANCE FOR NEW STATIONARY SOURCES

Subpart Db – Industrial, Commercial, Institutional Steam Generating Units

Section 60.40b states "The affected facility to which this subpart applies is each steam generating unit that commences construction, modification, or reconstruction after June 19, 1984, and that has a heat input capacity from fuels combusted in the steam generating unit of greater than 29 megawatts (MW) (100 million British thermal units per hour (MMBtu/hr))."

This Site will not have any steam generating units on-site. Therefore this regulation is not applicable to the intended Facility.

Subpart Dc - Small Industrial, Commercial, Institutional Steam Generating Units

As mentioned above, this Facility will not have any steam generating units on-site. Therefore this regulation is not applicable.

**Subpart K** – Standards of Performance for Storage Vessels for Petroleum Liquids for Which Construction, Reconstruction, or Modification Commenced After June 11, 1973, and Prior to May 19, 1978

This Facility was constructed after May 19, 1978. Therefore, this regulation does not apply.

**Subpart Ka** - Standards of Performance for Storage Vessels for Petroleum Liquids for Which Construction, Reconstruction, or Modification Commenced After May 18, 1978, and Prior to July 23, 1984

This Facility was constructed after July 23, 1984. Therefore, this regulation does not apply.

**Subpart Kb** - Standards of Performance for Volatile Organic Liquid Storage Vessels (Including Petroleum Liquid Storage Vessels) for Which Construction, Reconstruction, or Modification Commenced After July 23, 1984

Section 60.110b(d)(4) states "This subpart does not apply to Vessels with a design capacity less than or equal to 1,589.874 m<sup>3</sup> (approximately 13,333.34 barrels of condensate/oil) used for petroleum or condensate stored, processed, or treated prior to custody transfer.

This Facility has two (2) 400-bbl storage tanks associated with the main Site. Wellsite RBU 6-15E has one (1) 400-bbl storage tank while wellsite RBU 7-15E has one (1) 300-bbl storage tank. Total capacity of all four (4) storage tanks is 1,500 barrels. Since the Facility has a design capacity less than the above listed threshold of 1,589.874 m<sup>3</sup>, Subpart Kb does not apply.

**Subpart KKK** – Standards of Performance for Equipment Leaks of VOC from Onshore Natural Gas Processing Plants

Section 60.630(3)(e) states "A compressor station, dehydration unit, sweetening unit, underground storage tank, field gas gathering system, or liquefied natural gas unit is covered by this subpart if it is located at an onshore natural gas processing plant. If the unit is not located at

the plant site, then it is exempt from the provisions of this subpart." The definition for onshore natural gas processing plant, as found under Section 60.631, is "...any processing site engaged in the extraction of natural gas liquids from field gas, fractionation of mixed natural gas liquids to natural gas products, or both."

This Facility does not meet the definition of an onshore natural gas processing plant as it does not extract natural gas liquids from field gas or fractionate mixed natural gas liquids to natural gas production. Therefore, Subpart KKK does not apply to this Site.

Subpart LLL – SO<sub>2</sub> Emissions from Onshore Natural Gas Processing Facilities

Section 60.640(a) states "The provisions of this subpart are applicable to the following affected facilities that process natural gas: each sweetening unit, and each sweetening unit followed by a sulfur recovery unit."

This Facility does not utilize a sweetening unit or a sulfur recovery unit. Therefore, Subpart LLL is not applicable to this Site.

Subpart IIII - Stationary Compression Ignition Internal Combustion Engines

Section 60.4200(a) states "The provisions of this subpart are applicable to manufacturers, owners, and operators of stationary compression ignition (CI) internal combustion engines (ICE) as specified in paragraphs (a)(1) through (3) of this section. For the purposes of this subpart, the date that construction commences is the date the engine is ordered by the owner or operator."

The Facility does not have any stationary compression ignition internal combustion engines. Therefore, Subpart IIII does not apply.

#### Subpart JJJJ - Stationary Spark Ignition Internal Combustion Engines

Section 60.4230(a) states "The provisions of this subpart are applicable to manufacturers, owners, and operators of stationary spark ignition (SI) internal combustion engines (ICE) as specified in paragraphs (a)(1) through (5) of this section. For the purposes of this subpart, the date that construction commences is the date the engine is ordered by the owner or operator." As an operator, Section 60.4230(a)(3) reads "Owners and operators of stationary SI ICE that commence construction after June 12, 2006, where the stationary SI ICE are manufactured: (i) On or after July 1, 2007, for engines with a maximum engine power greater than or equal to 500 HP (except lean burn engines with a maximum engine power greater than or equal to 500 HP and less than 1,350 HP);

(ii) on or after January 1, 2008, for lean burn engines with a maximum engine power greater than or equal to 500 HP and less than 1,350 HP;

(iii) on or after July 1, 2008, for engines with a maximum engine power less than 500 HP; or (iv) on or after January 1, 2009, for emergency engines with a maximum engine power greater than 19 KW (25 HP)."

The Facility does not have any stationary spark ignition internal combustion engines. Therefore, Subpart JJJJ does not apply.

#### Subpart KKKK -- Stationary Combustion Turbines

According to Section 60.4300, the purpose of Subpart KKKK is to establish "emission standards and compliance schedules for the control of emissions from stationary combustion turbines that commenced construction, modification or reconstruction after February 18, 2005." Section 60.4305 states that Subpart KKKK is applicable if any stationary combustion turbine is installed after February 18, 2005 and is rated equal to or greater than 10.7 gigajoules (10 MMBtu/hr), based on the higher heating value of the fuel.

The Facility has installed a stationary combustion turbine after February 18, 2005. However, the maximum rating of the micro-turbine is 874,000 Btu/hr or 0.874 MMBtu/hr. Therefore, Subpart KKKK is not applicable to this Site.

#### 40 CFR 61 -- NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS

#### **Subpart V** – Equipment Leaks (Fugitive Emission Sources)

Section 61.240(a) states "The provisions of this subpart apply to each of the following sources that are intended to operate in volatile hazardous air pollutant (VHAP) service: pumps, compressors, pressure relief devices, sampling connection systems, open-ended valves or lines, valves, connectors, surge control vessels, bottoms receivers, and control devices or systems required by this subpart." The definition listed under Section 61.241 states that "In VHAP service means that a piece of equipment either contains or contacts a fluid (liquid or gas) that is at least 10 percent by weight a volatile hazardous air pollutant (VHAP) as determined according to the provisions of §61.245(d). The provisions of §61.245(d) also specify how to determine that a piece of equipment is not in VHAP service.

The Facility's gas analysis shows that gas lines are not in VHAP service since the VHAP percentage by weight is less than 10 percent (approximately 0.89 percent). However, any liquids at the Facility will exceed 10 percent by weight for VHAPs. Therefore, the Site will comply with Subpart V when pertaining to sources of liquids. Of note, this site does not have any pumps or compressors.

#### 40 CFR 63 – NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

#### Subpart HH – Oil and Natural Gas Production

Section 63.760(a) states "this subpart applies to the owners and operators of the emission points, specified in paragraph (b) of this section that are located at oil and natural gas production facilities that meet the specified criteria in paragraphs (a)(1) and either (a)(2) or (a)(3) of this section. Section 63.760(a)(1) reads "facilities that are major or area sources of hazardous air pollutants (HAP) as defined in §63.761..." Section 63.760(a)(2) reads "facilities that process, upgrade, or store hydrocarbon liquids prior to the point of custody transfer."

The Facility meets the criteria of a major source of HAPs as it emits more than 10 TPY of any one HAP and more than 25 TPY of any combination of HAPs (see enclosed emission calculations). Secondly, the Facility stores hydrocarbon liquids prior to the point of custody transfer. Therefore, this Site will comply with the requirements of Subpart HH.

The requirements listed under Section 63.765 (glycol dehydration unit vent standards) apply to the Facility as the exemptions based on production and benzene emissions listed in Section 63.760(e) are exceeded.

The requirements listed under Section 63.766 (storage vessel standards) do not apply to the Facility as the storage vessels do not meet the definition of "each storage vessel with the potential for flash emissions." Section 63.761 lists the definition as "storage vessel with the potential for flash emissions means any storage vessel that contains a hydrocarbon liquid with a stock tank GOR equal to or greater than 0.31 cubic meters per liter and an API gravity equal to or greater than 40 degrees and an actual annual average hydrocarbon liquid throughput equal to or greater than 79,500 liters per day. Flash emissions occur when dissolved hydrocarbons in the fluid evolve from solution when the fluid pressure is reduced." Actual annual average hydrocarbon liquid throughput is less than 79,500 liters (approximately 666 barrels) per day.

#### Subpart HHH -- Oil and Natural Gas Storage and Distribution

Section 63.1270(a) states "This subpart applies to owners and operators of natural gas transmission and storage facilities that transport or store natural gas prior to entering the pipeline to a local distribution company or to a final end user (if there is no local distribution company), and that are major sources of hazardous air pollutants (HAP) emissions as defined in §63.1271..."

The Facility transports natural gas prior to entering a pipeline and it is a major source of HAP emissions. However, further processing of the natural gas occurs prior to sending it to a local distribution company. Therefore, Subpart HHH is not applicable to this Site.

#### **Subpart EEEE** – Organic Liquids Distribution (non-gasoline)

According to Section 63.2330, the purpose of Subpart EEEE is to establish "...national emission limitations, operating limits, and work practice standards for organic hazardous air pollutants (HAP) emitted from organic liquids distribution (OLD) (non-gasoline) operations at major sources of HAP emissions. This subpart also establishes requirements to demonstrate initial and continuous compliance with the emission limitations, operating limits, and work practice standards." Section 63.2334(a) reads that "Except as provided for in paragraphs (b) and (c) of this section, you are subject to this subpart if you own or operate an OLD operation that is located at, or is part of, a major source of HAP emissions. An OLD operation may occupy an entire plant site or be collocated with other industrial (*e.g.*, manufacturing) operations at the same plant site."

Paragraph (c) in Section 63.2334 reads "Organic liquid distribution operations do not include the activities and equipment, including product loading racks, used to process, store, or transfer organic liquids at facilities listed in paragraph (c) (1) and (2) of this section.

(1) Oil and natural gas production field facilities, as the term "facility" is defined in §63.761 of subpart HH.

(2) Natural gas transmission and storage facilities, as the term "facility" is defined in §63.1271 of subpart HHH.

Therefore, Subpart EEEE does not apply to this Facility.

### Subpart YYYY - Stationary Combustion Turbines

According to Section 63.6080, the purpose of Subpart YYYY is to establish "...national emission limitations and operating limitations for hazardous air pollutants (HAP) emissions from stationary combustion turbines located at major sources of HAP emissions, and requirements to demonstrate initial and continuous compliance with the emission and operating limitations." Section 63.6085 states that Subpart YYYY is applicable if a company "owns or operates a stationary combustion turbine located at a major source of HAP emissions."

Furthermore, Section 63.6090(b) reads "Subcategories with limited requirements. (1) A new or reconstructed stationary combustion turbine located at a major source which meets either of the following criteria does not have to meet the requirements of this subpart and of subpart A of this part except for the initial notification requirements of §63.6145(d)..." The exemption under Section 63.6090(b)(2) reads "an existing, new, or reconstructed stationary combustion turbine with a rated peak power output of less than 1.0 megawatt (MW) at International Organization for Standardization (ISO) standard day conditions, which is located at a major source, does not have to meet the requirements of this subpart and of subpart A of this part. This determination applies to the capacities of individual combustion turbines, whether or not an aggregated group of combustion turbines has a common add-on air pollution control device. No initial notification. For example, a 0.75 MW emergency turbine would not have to submit an initial notification."

The Facility has installed a stationary combustion turbine with a rated peak power output of less than 1.0 MW at ISO standard day conditions. Therefore, Subpart YYYY is not applicable to this Site and does not have to submit an initial notification.

Subpart ZZZZ – Reciprocating Internal Combustion Engines (RICE)

Section 63.6580 states the purpose of Subpart ZZZZ as "establishes national emission limitations and operating limitations for hazardous air pollutants (HAP) emitted from stationary reciprocating internal combustion engines (RICE) located at major and area sources of HAP emissions. This subpart also establishes requirements to demonstrate initial and continuous compliance with the emission limitations and operating limitations." Section 63.6585 explains "You are subject to this subpart if you own or operate a stationary RICE at a major or area source of HAP emissions, except if the stationary RICE is being tested at a stationary RICE test cell/stand."

The Facility does not have any reciprocating internal combustion engines. Therefore, Subpart ZZZZ does not apply.

#### 40 CFR 64 – COMPLIANCE ASSURANCE MONITORING (CAM)

Section 64.2(a) states that "Except for backup utility units that are exempt under paragraph (b)(2) of this section, the requirements of this part shall apply to a pollutant-specific emissions unit at a major source that is required to obtain a part 70 or 71 permit if the unit satisfies all of the following criteria:

(1) The unit is subject to an emission limitation or standard for the applicable regulated air pollutant (or a surrogate thereof), other than an emission limitation or standard that is exempt under paragraph (b)(1) of this section;

(2) The unit uses a control device to achieve compliance with any such emission limitation or standard; and

(3) The unit has potential pre-control device emissions of the applicable regulated air pollutant that are equal to or greater than 100 percent of the amount, in tons per year, required for a source to be classified as a major source. For purposes of this paragraph, "potential pre-control device emissions" shall have the same meaning as "potential to emit," as defined in §64.1, except that emission reductions achieved by the applicable control device shall not be taken into account."

The Facility meets all three of the above listed criteria and does not qualify for any of the exemptions listed under Section 64.2(b)(1). Therefore, 40 CFR 64 applies to the Site.

### 40 CFR 68 - CHEMICAL ACCIDENT PREVENTION

Section 68.1 lists the scope as setting "...forth the list of regulated substances and thresholds, the petition process for adding or deleting substances to the list of regulated substances, the requirements for owners or operators of stationary sources concerning the prevention of accidental releases, and the State accidental release prevention programs approved under section 112(r). The list of substances, threshold quantities, and accident prevention regulations promulgated under this part do not limit in any way the general duty provisions under section 112(r)(1)."

Section 68.10 determines applicability as "An owner or operator of a stationary source that has more than a threshold quantity of a regulated substance in a process, as determined under §68.115, shall comply with the requirements of this part..."

Section 68.115(b)(2)(iii) states "For the purposes of determining whether more than a threshold quantity of a regulated substance is present at the stationary source, the following exemption..." for "Naturally occurring hydrocarbon mixtures. Prior to entry into a natural gas processing plant or a petroleum refining process unit, regulated substances in naturally occurring hydrocarbon mixtures need not be considered when determining whether more than a threshold quantity is present at a stationary source. Naturally occurring hydrocarbon mixtures include any combination of the following: condensate, crude oil, field gas, and produced water, each as defined in Sec. 68.3 of this part."

The production tanks (including the 30,000 gallon pressurized bullet tank) operate in condensate service, which is exempt from RMP applicability.

Therefore 40 CFR 68 does not apply to this Site.

#### 40 CFR 82 – STRATOSPHERIC OZONE AND CLIMATE PROTECTION

Section 82.1(a) lists "The purpose of the regulations in this subpart is to implement the Montreal Protocol on Substances that Deplete the Ozone Layer and sections 602, 603, 604, 605, 606, 607, 614 and 616 of the Clean Air Act Amendments of 1990, Public Law 101–549. The Protocol

and section 604 impose limits on the production and consumption (defined as production plus imports minus exports, excluding transhipments and used controlled substances) of certain ozone-depleting substances, according to specified schedules. The Protocol also requires each nation that becomes a Party to the agreement to impose certain restrictions on trade in ozone-depleting substances with non-Parties."

Furthermore, Section 82.1(b) states that "This subpart applies to any person that produces, transforms, destroys, imports or exports a controlled substance or imports or exports a controlled product."

The definition of controlled product is found under Section 82.3 and "means a product that contains a controlled substance listed as a Class I, Group I or II substance in appendix A to this subpart. Controlled products include, but are not limited to, those products listed in appendix D to this subpart..."

The definition of controlled substance under Section 82.3 "means any substance listed in appendix A or appendix B to this subpart, whether existing alone or in a mixture, but excluding any such substance or mixture that is in a manufactured product other than a container used for the transportation or storage of the substance or mixture. Thus, any amount of a listed substance in appendix A or appendix B to this subpart that is not part of a use system containing the substance is a controlled substance. If a listed substance or mixture must first be transferred from a bulk container to another container, vessel, or piece of equipment in order to realize its intended use, the listed substance or mixture is a "controlled substance." The inadvertent or coincidental creation of insignificant guantities of a listed substance in appendix A or appendix B to this subpart; during a chemical manufacturing process, resulting from unreacted feedstock, from the listed substance's use as a process agent present as a trace quantity in the chemical substance being manufactured, or as an unintended byproduct of research and development applications, is not deemed a controlled substance. Controlled substances are divided into two classes, Class I in appendix A to this subpart, and Class II listed in appendix B to this subpart. Class I substances are further divided into eight groups, Group I, Group II, Group III, Group IV, Group V, Group VI, Group VII, and Group VIII, as set forth in appendix A to this subpart."

The Facility is not currently using any Class I or Class II substances and does not plan to utilize either type of substances in the future. Therefore, 40 CFR 82 does not apply to this Site.

#### RE: Summit Gas Gathering, LLC - 2010 Initial Part 71 Permit Fee Payments River Bend Dehydrator Site & Accompanying Wellsites

To Whom It May Concern:

XTO Energy, hereby submits the attached payment for Title V – Part 71 Initial Permit fees for 2010 for the Summit Gas Gathering, LLC (SGG) River Bend Dehydrator Site & Accompanying Wellsites located in Uintah County, Utah. Also attached is the associated U.S. EPA fee Filing Form (FF).

If you should have any questions or require additional information, please feel free to contact me at (817) 885-2672.

Sincerely,

wy a

## D. Annual Emissions Report for Fee Calculation Purposes -- Non-HAP

You may use this to report actual emissions (tons per year) of regulated pollutants (for fee calculation) on a calendar-year basis for both initial and annual fee calculation purposes. Section E is designed to report HAP emissions. Quantify all actual emissions, including fugitives, but do not include insignificant emissions and certain regulated air pollutants that are not counted for fee purposes, such as CO (see instructions). You may round to the nearest tenth of a ton on this form. Sum the emissions in each column and enter a subtotal at the bottom of the page. If any subtotal exceeds 4,000 tons, enter 4,000 for that column.

| Emission Unit ID | NOx | VOC  | SO2 | PM10 | Lead     | Other |
|------------------|-----|------|-----|------|----------|-------|
| RBL-1            |     | 1.5  |     |      |          |       |
| RBTO-1           | 0.9 |      |     |      |          |       |
| RBD-1            |     | 1.1  |     |      |          |       |
| RBF-1            |     | 5.4  |     |      |          |       |

## E. Annual Emissions Report for Fee Calculation Purposes -- HAP

<u>HAP Identification</u>. Identify individual HAP emitted at the facility, identify the CAS number, and assign a unique identifier for use in the second table in this section. Whenever assigning identifier codes, use "HAP1" for the first, "HAP2" for the second, and so on.

| Name of HAP                  | CAS No  | Identifier |
|------------------------------|---------|------------|
| Benzene                      | 71432   | HAP1       |
| Ethylbenzene                 | 100414  | HAP2       |
| Toluene                      | 108883  | HAP3       |
| Xylene                       | 1330207 | HAP4       |
| n-Hexane                     | 110543  | HAP5       |
| 2,2,4 Trimethylpentane (TMP) | 540841  | HAP6       |
|                              |         |            |
|                              |         |            |

<u>HAP Emissions</u>. Report the actual emissions of individual HAP identified above. Use the identifiers assigned in the table above. Include all emissions, including fugitives, and do not include insignificant emissions. You may round to the nearest tenth of a ton. Sum the emissions in each column and enter a subtotal at the bottom of the page. If any subtotal exceeds 4,000 tons, enter 4,000.

This data is for \_\_\_\_\_2010\_\_\_\_\_ (year)

| Emissions Unit ID |      | Actual Emissions (Tons/Year) |      |      |      |      |     |     |

### F. Fee Calculation Worksheet

This section is used to calculate the total fee owed for both initial and annual fee payment purposes. Reconciliation is only for cases where you are paying the annual fee and you used any type of estimate of actual emissions when you calculated the initial fee. If you do not need to reconcile fees, only complete line 1-5 and then skip down to lines 21 - 26. See instructions for more detailed explanation.

| 1. Sum the emissions from section D of this form (non-HAP) and enter the total (tons).                                                                                                                                                                                                                                           | 32.6          |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| 2. Sum the emissions from section E of this form (HAP) and enter the total (tons).                                                                                                                                                                                                                                               | 2.5           |
| 3. Sum lines 1 and 2.                                                                                                                                                                                                                                                                                                            | 35.1          |
| 4. Enter the emissions that were counted twice. If none, enter "0."                                                                                                                                                                                                                                                              | 2.5           |
| 5. Subtract line 4 from line 3, round to the nearest ton, and enter the result here.                                                                                                                                                                                                                                             | 32.6          |
| RECONCILIATION<br>(WHEN INITIAL FEES WERE BASED ON ESTIMATES<br>FOR THE "CURRENT" CALENDAR YEAR)                                                                                                                                                                                                                                 |               |
| Only complete lines 6-10 if you are paying the first annual fee and initial fees were based on emissions for the calendar year in which you paid initial fees; otherwise skip to line 11 or to lin                                                                                                                               |               |
| <ol><li>Enter the total estimated actual emissions for the year the initial fee was paid<br/>(previously reported on line 5 of the initial fee form).</li></ol>                                                                                                                                                                  |               |
| <ol> <li>If line 5 is greater than line 6, subtract line 6 from line 5, and enter the result.<br/>Otherwise enter "0."</li> </ol>                                                                                                                                                                                                |               |
| <ol> <li>If line 6 is greater than line 5, subtract line 5 from line 6, and enter the result.<br/>Otherwise enter "0."</li> </ol>                                                                                                                                                                                                | ······        |
| <ol> <li>If line 7 is greater than 0, multiply line 7 by last year's fee rate (\$/ton) and enter the<br/>result here. This is the underpayment. Go to line 21.</li> </ol>                                                                                                                                                        |               |
| <ol> <li>If line 8 is greater than 0, multiply line 8 by last year's fee rate (\$/ton) and enter the<br/>result here. This is the overpayment. Go to line 21.</li> </ol>                                                                                                                                                         |               |
| RECONCILIATION<br>(WHEN INITIAL FEES WERE BASED ON ESTIMATES<br>FOR THE "PRECEDING" CALENDAR YEAR)                                                                                                                                                                                                                               |               |
| Only complete lines 11-20 if you are paying the first annual fee and initial fees were based on emissions for the calendar year preceding initial fee payment; otherwise skip to line 21. If con section, you will also need to complete sections D and E to report actual emissions for the cale preceding initial fee payment. | npleting this |
| 11. Sum the actual emissions from section D (non-HAP) for the calendar year preceding initial fee payment and enter the result here.                                                                                                                                                                                             |               |
| <ol> <li>Sum the actual emissions from section E (HAP) for the calendar year preceding<br/>initial fee payment and enter the result here.</li> </ol>                                                                                                                                                                             |               |
| 13. Add lines 11 and 12 and enter the total here. These are total actual emissions for<br>the calendar year preceding initial fee payment.                                                                                                                                                                                       |               |
| 14. Enter double counted emission from line 13 here. If none, enter "0."                                                                                                                                                                                                                                                         |               |
| 15. # **Technical Reference**

# **Capstone MicroTurbine<sup>TM</sup> Systems Emissions**

# Summary

Capstone MicroTurbine<sup>™</sup> systems are inherently clean and can meet some of the strictest emissions standards in the world. This technical reference is to provide customers with information that may be requested by local air permitting organizations or to compare air quality impacts of different technologies for a specific project. The preferred units of measure are "output based"; meaning that the quantity of a particular exhaust emission is reported relative to the useable output of the microturbine – typically in pounds per megawatt hour for electrical generating equipment. This technical reference also provides the volumetric measurement in parts per million, which is still used by many people. A conversion between several common units is also provided.

# **Maximum Exhaust Emissions at ISO Conditions**

Table 1 below summarizes the exhaust emissions at full power and ISO conditions for different Capstone microturbine models. Note that the fuel can have a significant impact on certain emissions. For example landfill and digester gas can be made up of a wide variety of fuel elements and impurities, and typically contains some percentage of carbon dioxide (CO<sub>2</sub>). This CO<sub>2</sub> dilutes the fuel, makes complete combustion more difficult, and results in higher carbon monoxide emissions (CO) than for pipeline-quality natural gas.

| Model           | Fuel                        | NOx | CO  | VOC (5) |
|-----------------|-----------------------------|-----|-----|---------|

Table 2. Emission for Different Capstone Microturbine Models in [g/hp-hr]

Notes: - same as for Table 1

Emissions may also be reported on a volumetric basis, with the most common unit of measurement being parts per million. This is typically a measurement that is corrected to specific oxygen content in the exhaust and without considering moisture content. The abbreviation for this unit of measurement is "ppmvd" (parts per million by volume, dry) and is corrected to 15% oxygen for electrical generating equipment such as microturbines. The relationship between an output based measurement like pounds per MVVh and a volumetric measurement like ppmvd depends on the characteristics of the generating equipment and the density of the criteria pollutant being measured. Table 3 expresses the emissions in ppmvd at 15% oxygen for the Capstone microturbine models shown in Table 1. Note that raw measurements expressed in ppmv will typically be lower than the corrected values shown in Table 3

The emissions stated in Tables 1, 2 and 3 are guaranteed by Capstone for new microturbines during the standard warranty period. They are also the expected emissions for a properly maintained microturbine according to manufacturer's published maintenance schedule for the useful life of the equipment.

Notes: same as Table 1

# **Emissions at Full Power but Not at ISO Conditions**

The maximum emissions in Tables 1, 2 and 3 are at full power under ISO conditions. These levels are also the expected values at full power operation over the published allowable ambient temperature and elevation ranges.

## **Emissions at Part Power**

Capstone microturbines are designed to maintain combustion stability and low emissions over a wide operating range. Capstone microturbines utilize multiple fuel injectors, which are switched on or off depending on the power output of the turbine. All injectors are on when maximum power is demanded, regardless of the ambient temperature or elevation. As the load requirements of the microturbine are decreased, injectors will be switched off to maintain stability and low emissions. However, the emissions relative to the lower power output may increase. This effect differs for each microturbine model.

410065 Rev. A (February 2008)

# **Emissions Calculations for Permitting**

Air Permitting agencies are normally concerned with the maximum amount of a given pollutant being emitted per unit of time (for example pounds per day of NOx). The simplest way to make this calculation is to use the maximum microturbine full electrical power output (expressed in MW) multiplied by the emissions rate in pounds per MWhe times the number of hours per day. For example, the C65 CARB microturbine operating on natural gas would have a NOx emissions rate of:

NOx = .17 X (65/1000) X 24 = .27 pounds per day

This would be representative of operating the equipment full time, 24 hours per day, at full power output, 65 kWe.

As a general rule, if local permitting is required, use the published agency levels as the stated emissions for the permit and make sure that this permitted level is above the calculated values in this application guide.

# **Consideration of Useful Thermal Output**

Capstone microturbines are often deployed where their clean exhaust can be used to provide heating or cooling, either directly or using hot water or other heat transfer fluids. In this case, the local permitting or standards agencies will usually consider the emissions from traditional heating sources as being displaced by the useful thermal output of the microturbine exhaust energy. This accounts for the increased useful output of the microturbine, and decreases the relative emissions of the combined heat and power system. For example, the CARB version C65 ICHP system with integral heat recovery can achieve a total system efficiency of 70% or more, depending on inlet water temperatures and other installation specific characteristics. The efficiency of the CARB version C65 microturbine is 28% at ISO conditions. This means that the total NOx output based emissions, including the captured thermal value, is the electric-only emissions times the ratio of electric efficiency divided by total system efficiency:

NOx = .17 X 28/70 = .068 pounds per MWh (based on total system output)

This is typically much less than the emissions that would result from providing electric power using traditional central power plants, plus the emissions from a local hot water heater or boiler. In fact microturbine emissions are so low compared with traditional hot water heaters that installing a Capstone microturbine with heat recovery can actually decrease the local emissions of NOx and other criteria pollutants, without even considering the elimination of emissions from a remote power plant.

# **Greenhouse Gas Emissions**

Many gasses are considered "greenhouse gasses", and agencies have ranked them based on their global warming potential (GWP) in the atmosphere compared with carbon dioxide (CO<sub>2</sub>), as well as their ability to maintain this effect over time. For example, methane is a greenhouse gas with a GWP of 21. Criteria pollutants like NOx and organic compounds like methane are monitored by local air permitting authorities, and are subject to strong emissions controls. So even though some of these criteria pollutants can be even more troublesome for global warming than CO<sub>2</sub>, they are released in small quantities – especially from Capstone

## 410065 Rev. A (February 2008)

### Page 4 of 7

microturbines. So the major contributor of concern is carbon dioxide, or CO<sub>2</sub>. Emissions of CO<sub>2</sub> depend on two things:

- 1. Carbon content in the fuel
- 2. Efficiency of converting fuel to useful energy

It is for these reasons that many local authorities are focused on using clean fuels (for example natural gas compared with diesel fuel), achieving high efficiency using combined heat and power systems, and displacing emissions from traditional power plants using renewable fuels like waste landfill and digester gasses.

Table 5 shows the typical CO<sub>2</sub> emissions from different Capstone microturbine models at full power and ISO conditions and for different fuels. Theses values are expressed on an output basis, as is done for criteria pollutants in Table 1. The table shows the pounds per megawatt hour based on electric power output only, as well as considering total useful output in a CHP system with total 70% efficiency (LHV). As for criteria pollutants, the relative quantity of CO<sub>2</sub> released is substantially less when useful thermal output is also considered in the measurement. As a comparison, coal fired central power plants account for 50% of the electric generation in the US, with an average CO<sub>2</sub> emissions rate of 2,138 pounds per megawatt hour according to Environmental Protection Agency data. Note that any of the Capstone models noted below emit less CO<sub>2</sub>, with or without consideration for the useful thermal energy captured with a combined heat and power application.

| Model        | Fuel                        | C             | 02            |
|--------------|-----------------------------|---------------|---------------|
|              |                             | Electric Only | 70% Total CHP |

# Definitions

- ISO conditions are defined as: 15 °C (59 °F), 60% relative humidity, and sea level pressure of 101.3 kPa (14.696 psia).
- HHV: Higher Heating Value
- LHV: Lower Heating Value
- kWth: Kilowatt (thermal)
- kW<sub>e</sub> : Kilowatt (electric)
- MWh: Megawatt-hour
- bhp-hr: brake horsepower-hour
- Scf: Standard cubic feet (standard references ISO temperature and pressure)
- SCFM: Standard Cubic Feet per Minute (standard references ISO temperature and pressure)

# Capstone Introduces the C65 Energy Systems

C65 & C65-IC More power & C65-ICHP: Better fuel efficiency too Even lower NOx emissions Same compact dimensions

In 2006, Capstone Turbine introduces a significant improvement to the world's most popular line of microturbine energy systems. Replacing the C60 product, the new C65 offers greater electrical output, more heat energy, higher fuel efficiency, heavier-duty power electronics, and < 10-sec. fast transfer on dual-mode units, all with the same dimensions, weights and other advantages of the original:

- · Just one moving part, no gearbox, no radiator, etc.
- \* No oil, lubricants, coolants or other hazmats
- Quiet, small footprint, light weight, vibration-free
- 10% federal tax credit; other incentive programs
- · Cleaner and more fuel efficient power and heat
- · 80% CHP efficiency: measured at end-user loads
- As easy as it gets interconnect and air permitting
- Integrated synchronizing & load-sharing
- · Built-in capability to array up to 20 units as one
- · Indoor, outdoor or rooftop installation
- · Easy integration into energy management systems
- · Optional remote monitoring, dispatch, diagnostics
- · Made in USA

Models are available with optional CE Marking. Certification to California Air Resources Board Emissions requirements is in process.

\* With linear load.

\*\* Optional external fuel gas boosters are available for inlet gas pressures from 0.2 to 15.0 psig.

\*\*\* Values are for 40 gpm (2.5 l/s) water flow rate: copper core version with 140°F (60°C) inlet water; stainless steel version (primarily for chlorinated water) with 85°F (30°C) inlet water.

Specifications are not warrantied and are subject to change without notice. Warrantied specifications are documented separately.

Pipeline Pressure provided by client

Wet Gas composition used for calculations

Emissions (tpy) = Volume released (Mscf/yr) x Weight Fraction x 1000 (scf/Mscf) x 1/379.45 (lb-mol/scf) x MW (lb/mol) / 2000 (lb/ton)

4

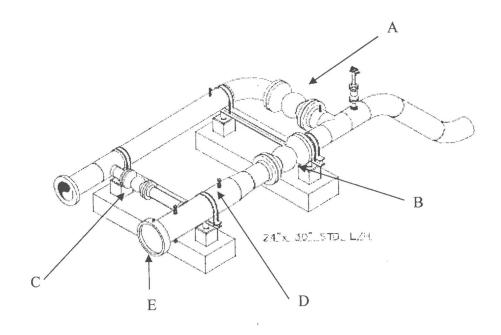

# SGG ROOSEVELT – PIPELINE PIGGING PROCEDURES

## **PIG LAUNCHING**

- 1. Close valves on launch tubes (B&C) and depressurize tube with a blowdown valve (D).
  - a. Gas within the pig launcher is emitted to the environment.
- 2. Open the pig barrel lid (E) and insert pig into launcher. Close lid (E).
  - a. Pig barrel is at atmospheric pressure.
- 3. Open equalizer valve (C) to pressure pig on the back side.
  - a. Gas is contained in the gathering system.
- 4. Close bypass valve (A) and open main valve (B) to allow pig to travel down the pipeline.
  - a. Gas is contained within the gathering system.
- 5. Once pigging is complete close equalizer valve (C) and main valve (B). Open bypass valve (A) to continue flowing gas within the gathering system.
  - a. Gas is contained within the gathering system.

## **PIG RECEIVING**

- 1. Open pig receiver main valve (B) to allow pig to enter pig receiver tube.
- 2. Open equalizer valve (C) to allow gas and fluid through the pig receiver.
- 3. Close main throughput valve (A) to divert pig into receiver.
  - a. Gas and fluid collected during the pigging operation flows through the receiver and is carried to the existing station scrubber.
  - b. Gas flows through the scrubber and remains within the gathering system.
  - c. Fluids collected during the pigging operation flow from the scrubber to the existing onsite storage tank.
- 4. Once the pig has been recovered, open the main throughput valve (A), close equalizer valve (C), and close main valve (B).
  - a. Gas is contained within the gathering system.
- 5. Blow down the pig receiver using the blowdown valve (D).
- a. Gas within the pig receiver is emitted to the environment.
- 6. Open the pig barrel lid (E) and extract pig.
  - a. Pig barrel is at atmospheric pressure.
  - b. Excess fluids left in the pig receiver barrel are recovered in a portable catch basin.

### Criteria emissions rounded to the nearest 1/100 of a ton, VOC/HAP rounded to 1/1000 of a ton.

EF AP-42<sup>1</sup> = emission factor from AP-42 Table 1.4-1, Small Boilers <100 MMbtu/hr (EPA 7/98), Standard = 1,020 Btu/scf

 $EF AP-42^2 = emission factor from AP-42 Table 1.4-2$  (EPA 7/98)

 $EF AP-42^3$  = emission factor from AP-42 Table 1.4-2 (EPA 7/98)

Fuel Consumption (MMscf/yr) = Heater Size (MBtu/hr) \* 1,000 (Btu/MBtu) \* Hours of Operation (hrs/yr) Fuel Heat Value (Btu/scf) \* 1,000,000 (scf/MMscf) \* Heater Efficiency

NOx/CO/TOC Emissions (tons/yr) = AP-42 EF (lbs/MMscf) \* Fuel Consumption (MMscf/yr) \* (Fuel Heat Value/ Standard Fuel Heat Value) / 2,000 (lbs/ton) -Standard Fuel Heat Value, Natural Gas (AP-42, 7/98, p1.4-5) = 1,020 Btu/scf

VOC emissions assumed equal to TOC emissions

Dehydrator still vent controlled 99% through the use of a thermal oxidizer (see attached information)

\*CO<sub>2</sub> and Methane emissions are expressed in metric tons per GHG requirements.

\*\* Flash gas separator is routed to two places: any liquids go to the bullet tank onsite; gas is routed to a suction line and sent off-site to the Tap 1 Compressor Station.

GRI-GLYCalc VERSION 4.0 - AGGREGATE CALCULATIONS REPORT

Case Name: Summit Gas Gathering - River Bend Dehy Site File Name: Y:\Utah\River Bend Dehy Site\Buys RB Dehy TV Application\River Bend Dehydrator emissions\_rev 1\_Jan 13\_2011.ddf Date: January 14, 2011

### DESCRIPTION:

Description: 45 MMscfd with flash tank and thermal oxidizer 45015 glycol pump (electric) PTE uncontrolled and controlled

Annual Hours of Operation: 8760.0 hours/yr

#### EMISSIONS REPORTS:

\_\_\_\_\_

### Mike Riddell

### V.P. EnviroTherm Environmental Products Division

a division of Industrial Refractory Services Inc.

- (1) Waste Steam data was provided from XTO Energy using GRI-GLYCalc Version 4.0 simulations.
- (2) Average Combustion Chamber temperature is measured one pipe dia. from the top of the stack.
- (3) The minimum combustion chamber temperature is derived from the Auto-Ignition Temperature required to ignite the constituent fuels without a spark or flame.
- (4) The combustion gas constituent concentrations are derived from actual performance test data collected from Thermal Oxidizers of the same design and similar waste gas input.
- (5) The BTU value is derived using the Mol% and the HHV of each constituent to determine the HHV of the mixture.
- (6) Max Firing Rate is achieved when the combustion air blower is running at full speed (60 Hz).
- (7) Burner Average Firing Rate is archived once the system has reached its operating temperature and the waste stream is providing BTU heat source.

#### Criteria emissions rounded to the nearest 1/100 of a ton, VOC/HAP rounded to 1/1000 of a ton.

EF AP-42<sup>1</sup> = emission factor from AP-42 Table 1.4-1, Small Boilers <100 MMbtu/hr (EPA 7/98), Standard = 1,020 Btu/scf

 $EF AP-42^2$  = emission factor from AP-42 Table 1.4-2 (EPA 7/98)

EF AP- $42^3$  = emission factor from AP-42 Table 1.4-2 (EPA 7/98)

Fuel Consumption (MMscf/yr) = Heater Size (MBtu/hr) \* 1,000 (Btu/MBtu) \* Hours of Operation (hrs/yr) Fuel Heat Value (Btu/scf) \* 1,000,000 (scf/MMscf) \* Heater Efficiency

NOx/CO/TOC Emissions (tons/yr) = AP-42 EF (lbs/MMscf) \* Fuel Consumption (MMscf/yr) \* (Fuel Heat Value/ Standard Fuel Heat Value) / 2,000 (lbs/ton) -Standard Fuel Heat Value, Natural Gas (AP-42, 7/98, p1.4-5) = 1,020 Btu/scf

VOC emissions assumed equal to TOC emissions

### WELLSITE UNCONTROLLED CONDENSATE TRUCK LOADING EMISSIONS

Company: Summit Gas Gathering Facility Name: RBU 6-15E Facility Location: Uintah County, Utah

AP - 42, Chapter 5.2

#### $L_L$ = 12.46 x S x P x M / T Emissions = $L_L$ \* Throughput

TABLE 1. Emission factors are calculated utilizing AP-42 equations and data from EPA TANKS 4.09 LL is converted to tpy VOC emissions per barrel of production per

- L<sub>L</sub> = Loading Loss Emission Factor (lbs VOC/1000 gal Loaded)
  - S = Saturation Factor (0.6 For Submerged Loading Dedicated Service)
  - P = True Vapor Pressure of the Loaded Liquid (psi)
  - M = Vapor Molecular Weight of the Loaded Liquid (lbs/lbmol)
  - T = Temperature of Loaded Liquid (°R)
