Date: 7/27/2017
Subject: Review of Region 5 Data for Mid America Steel Drum, Inc.
To: RCRA, LCD, US EPA Region 5
77 West Jackson Boulevard
Chicago, IL 60604
From: Kristen Leckrone, Chemist
US EPA Region 5 Chicago Regional Laboratory

The data transmitted under this cover memo successfully passed CRL's data review procedures as documented in the current Quality Management Plan and applicable Standard Operating Procedures. In accordance with the EPA QA/G-8 *Guidance on Environmental Data Verification and Data Validation* and the U.S. EPA Region 5 RMD QMP, CRL performs data verification on all the data generated internally. CRL does not perform data validation or quality assessment procedures.

This report was reviewed and the information provided herein accurately represents the analysis performed.

X Kristen Leckrone 7/27/17

Please contact the analyst with any technical report issues, Robert Thompson at (312)-353-9078 for sample project concerns, and Sylvia Griffin at (312)-353-9073 with data transmittal questions. Thank you.

Attached are Results for: Mid America Steel Drum, Inc.

General Information

Twenty-five solid, liquid and mixed waste samples were received on 5/05/2017 for prepared for analysis by the toxicity characteristic leaching procedure (TCLP) using zero headspace extraction (ZHE) by analysts Troy Strock, Danielle Kleinmaier and Greg Mitsakopoulos. The TCLP extracts were subjected to volatile organics analysis (VOA). The designated VOA analyst, Kristen Leckrone, can be reached at (312) 353-9068. The TCLP procedure has a 14-day holding time from sample collection to TCLP preparation, and an additional 14-day holding time from TCLP preparation to volatile organics analysis. Some samples exceeded their preparation and/or analysis holding times. See the Quality Control (QC) section for more details. All samples were refrigerated at ≤ 6 C when not in use.

Sample Analysis

TCLP preparation of the samples followed Chicago Regional Laboratory (CRL) Standard Operating Procedure (SOP) GEN019 Ver. 5, based on SW-846 Method 1311. VOA in most of the TCLP extracts followed CRL SOP MS023 Ver.5, based on SW-846 reference method 8260C for VOA in water. The following modifications were required to analyze samples not amenable to standard VOA in aqueous samples. These analyses were conducted by Danielle Kleinmaier.

Samples 1705002-02, 1705002-09 and 1705003-02 produced water-immiscible TCLP extracts, while samples 1705003-01 and 1705003-03 produced extracts with limited water miscibility. Many of these samples were also extremely viscous. These five TCLP extracts were analyzed for volatile compounds by first performing a methanol extraction of a measured mass of extract, for which corresponding volumes were calculated through density, as measured at CRL. This portion of the procedure followed CRL SOP MS001 Ver. 4. The methanol extracts were diluted in water at the bench and analyzed per MS023. Results from methanol extracts are reported in mg/L, after accounting for dilution. In some cases, the water-immiscible extract was miscible with methanol, and dilution factors were adjusted to account for the altered final volume, resulting in dilution factors intermediate between standard 10x, 100x or 1000x dilutions. Dilution factors for these and all other samples are documented in the LIMS report.

Samples 1705002-04, 1705002-08 and 1705002-12 each produced two immiscible TCLP fractions: a water-immiscible 1st filtrate and an aqueous, leached 2nd filtrate. For each sample, the two immiscible TCLP fractions were assigned distinct laboratory identifiers (ID), as shown in the sample ID table of this report. Immiscible fractions were analyzed separately, as follows. The water-immiscible 1st filtrate was methanol-extracted, diluted, and analyzed in the same way as the other water-immiscible extracts described above. The aqueous 2nd filtrate was directly analyzed per MS023. The separate analyses were mathematically combined using a volume-weighted average, per GEN019. The combined final results are reported under the original sample id number. Results from the separate analyses are included in this report to document the input concentrations for the volume-weighted averages as well as to document acceptable surrogate recovery. However, only the final, calculated result reported under the original sample ID should be compared to the TCLP regulatory limits.

One highly alkaline sample (1705003-08) was acidified with 1:1 HCl-H₂O to a pH of 6 as per pen-and-ink change #10392 prior to analysis per MS023.

Reported:
Jul-27-17 15:33

Regardless of the preparation method, all extracts were analyzed for the subset of volatile organic analytes listed in 40 CFR Part 261.24, and data were evaluated against the regulatory limits listed therein. Data were reviewed according to the guidelines described in CRL SOP GEN010 Version 2: Organics Data Verification, hereafter referred to as GEN010.

Sample Results

The data reported in this package meet the requirements in MS023, GEN010, and the Quality Assurance Project Plan for Field Sampling Events at Mid-America Steel Drum, Inc, dated April 19, 2017, except as noted in the Quality Control section below.

Methyl ethyl ketone (2-butanone) in sample 1705002-04 (36,300 mg/L) was above the TCLP regulatory limit of 200 mg/L. This result is a weighted average of immiscible fractions.

Benzene in samples 1705002-01 (0.571 mg/L), 1705002-02 (0.683 mg/L), and 1705002-09 (9.26 mg/L) also exceeded the TCLP regulatory limit of 0.50 mg/L.

Target compounds were either not detected, or were present below TCLP regulatory limits in all other field samples. (Please note that samples 1705002-14, -15, -16, -17, -18 and -20 are measurements on separated fractions of biphasic field samples and are not directly comparable to TCLP regulatory limits).

Detailed results are included in the attached report and electronic spreadsheet.

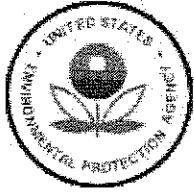

Quality Control

All Quality Control (QC) audits were within CRL limits for all analytes, or did not result in qualification of data, except as discussed below. Discussion of QC is organized first by QC parameter, then by batch when appropriate.

Holding times and sample preservation.

Holding times (14-days) between sampling and TCLP extraction were exceeded for the following samples: 1705002-04, 1705002-08, 1705002-12, 1705002-14, 1705002-15, 1705002-16, 1705002-17, 1705002-18 and 1705002-20. Additionally, 14-day holding times between TCLP extraction and VOA analysis were exceeded for the following sample injections or re-injections from which data are reported: 1705002-02, 1705002-06, 1705002-06RE1 (reported only as source sample for B17F008-MS1 and -MSD1), 1705002-06RE2, 1705002-08, 1705002-09, 1705002-10RE1, 1705002-11RE1, 1705002-13, 1705002-17, 1705003-01, 1705003-02, 1705003-03, 1705003-04RE1, 1705003-05, 1705003-07, and 1705004-09, as well as TCLP preparation blanks collected on 5/15 (B17F014-BLK2) and 5/19 (B17F014-BLK3). All affected data are qualified "H" in the sample header. Since in VOA the consequence of excessive holding time is generally potential loss of the volatile analytes, the reported concentrations may under-estimate the actual concentrations in the samples as received.

Additionally, leachates, filtrates and/or extracts produced from the following samples were either stored with or generated headspace in the vial: 1705002-02, 1705002-14, 1705002-15, 1705002-16 and 1705002-18, and 1705003-07. Since these samples are already qualified for exceeding holding time limits, additional qualifiers were not required. Sample pH is measured/adjusted/controlled by the TCLP extraction procedure so separate pH measurement and adjustment by the VOA

analyst were not required, except for sample 1705003-08 as discussed above.

Initial calibration.

Two instrument calibrations were used for these analyses. The first calibration applies to batches B17G019, B17G020 and B17G021. The purge & trap interface was cleaned and baked and the instrument re-calibrated prior analysis of batches B17F006, B17F008 and B17F014. All QC requirements for each initial calibration were met.

Continuing calibration verification.

Batch B17F104. The recovery of 2-butanone exceeded the upper QC limit in the mid-sequence CCV and the ending CCV of this batch. The following samples were flagged 'K', (CCV) for 2-butanone: B17F014-BLK3, 1705002□16, 1705002□18, 1705002□09, B17F014-MS1, and B17F014-MSD1.

Blank spike/blank spike duplicate.

Batch B17G019. Carbon tetrachloride recovery was low in the blank spike duplicate and is qualified UJ for non-detects in the associated samples that are reported.

Batch B17G020, Carbon tetrachloride recovery was low in the blank spikes and is qualified UJ for non-detects in the associated samples that are reported.

Batch B17G021. 2-Butanone recovery was low in BS3, BSD1, and BSD2. It is qualified UJ for non-detects and L for potential low bias in the associated samples that are reported.

Batch B17G021. Carbon tetrachloride recovery was low in all blank spikes. It is qualified UJ for non-detects in the associated samples that are reported.

Batch B17G021. Trichloroethene had high recovery in BSD3. It was not detected in associated samples, so no data were flagged.

Internal standards.

Batch B17F104. The following samples had low recovery of 1,4-dichlorobenzene-d4: 1705002-09, -18, B17F014-MS1, and -MSD1. This is most likely due to a matrix interference. The only analyte affected is 1,4-dichlorobenzene, which is flagged 'J' (IS) in these samples.

Batch B17G019: In sample 1705003-06, the internal standard fluorobenzene had a retention time shift of +0.63 minutes, although its area recovery was acceptable, and the internal standard 1,4-dichlorobenzene-D4 eluted at the correct retention time but with low recovery. Target analytes quantified relative to these two internal standards are flagged J, "IS". (All target compounds in this sample are also qualified J due to failure of the surrogates, see next section).

Surrogate recovery.

General considerations. Individual surrogate standards, especially dibromofluoromethane, were recovered low in multiple samples. Per MS023 and GEN010 guidance, qualification of samples for failed surrogates is not required unless three or more surrogates fail in a sample.

Batch B17F014. The recoveries of all surrogates in sample 1705002-09 were outside QC limits. Dibromofluoromethane recovered high while 1,2-dichloroethane-d4 and 4-bromofluorobenzene recovered low. Toluene-d8 was not recovered at

Reported:
Jul-27-17 15:33

all. This is all most likely due to matrix interferences. The entire sample is qualified "SURR", and all target analytes in 1705002-09 are also qualified 'J' unless superceded by other, more specific qualifiers. The surrogate recoveries in the matrix spikes were similar to the native sample above; all the target analytes in B17F014-MS1/-MSD1 are qualified 'J' and the entire QC samples qualified "SURR".

Batch B17G019. Three surrogates in 1705003-06 were recovered below the lower QC limit. The entire sample is qualified "SURR" and all target analytes are also qualified "J", estimated.

Surrogate standards are not reported for 1705002-04, 1705002-08 or 1705002-12, which are calculated results rather than direct measurements. Surrogate recoveries for the measured field samples used in the calculation of these standards are reported in samples 1705002-14, 1705002-15, 1705002-16, 1705002-17, 1705002-18 and 1705002-20. All surrogates in the contributing samples were within QC limits except for 1705002-18, in which two surrogates failed, but this did not result in sample qualification.

Matrix spike/matrix spike duplicates (MS/MSD)

Matrix spikes were prepared in volumetric flasks during the bench dilutions of field samples. Thus, they are spikes of the 100x or 1000x diluted matrix, rather than spikes of the undiluted matrix. Since the spikes were added after dilution, MS results are not adjusted for the dilution factor, and are best calculated relative to the source sample's signal uncorrected for dilution. This allows the recovery of the spiked target compounds to calculate correctly.

Batch B17G021. For the MS2/MSD2, the QC check is irrelevant for 2-butanone, whose concentration in the source sample was >50% of the spike level. No data were flagged for this compound based on the MS2/MSD2.

Batch B17G021. Carbon tetrachloride recovery was low in the matrix spikes. It is qualified UJ for non-detects in the associated samples that are reported.

Batch B17F014. In both the B17F014-MS and -MSD, trichloroethene recovered low while carbon tetrachloride was not recovered at all. Trichloroethene is therefore flagged 'J' (MS) in the native sample and carbon tetrachloride is flagged 'R' (MS). Surrogate recoveries in the B17F014-MS and -MSD are addressed in the "surrogate recovery" QC section. Benzene and 1,4-dichlorobenzene also had low recoveries in the -MSD and are flagged J, estimated, in the source sample.

Batches B17F006, B17G019, and B17G020 did not include MS/MSDs.

Method blanks.

As described in the sample analysis section, field samples were prepared as TCLP filtrates and/or leachates, and if needed, further processed by methanol extraction, and in one instance acidification, before the VOA analysis. A blank relevant to every preparative step was prepared, analyzed, and evaluated relative to all field samples associated with that step. Per MS023 and GEN010, for any given target analyte, a result must be qualified "B", potentially affected by blank, if the analyte concentration is above the reporting limit but less than five times the concentration of any relevant blank. All the procedural blanks, as well as the daily method blanks, had results below the reporting limit, and did not result in qualification of associated sample data, with the following exception:

The 5/19/17 leaching blank, analyzed as B17F014-BLK3 and also as B17G019-BLK3, contained 2-butanone above the

reporting limit. The higher measurement, that in B17F014-BLK3, was used to evaluate the blank's impact on its associated samples. Two samples, 1705004-07 and 1705004-08, had 2- butanone results within five times the level of the blank, and are qualified "B", as well as "K" to indicate that the blank may have biased the results high. All other associated samples were either non-detect or greater than five times the level in the blank. 1705002-05RE (>5x), 1705002-06 (>5x), 1705002-10 (>5x), 1705002-11 (>5x), 1705003-04 (ND), 1705004-10RE (ND).

Reporting Limits checks.

All reporting limit checks were met in all reporting limit check samples, and reporting limits for all target compounds in all field samples are below the TCLP regulatory limits, with the following exceptions:

The reporting limits for all compounds in calculated sample **1705002-04** and its contributing samples **1705002-14** and **1705002-15** exceed the TCLP regulatory limits. This was an unavoidable consequence of the extremely high dilutions required to keep the massive 2-butanone peak within the calibration range. The contributing samples could not be analyzed at lower dilution without risk of damaging the purge-and-trap concentrator.

In the calculated sample **1705002-12**, reporting limits for vinyl chloride, 1,1-dichloroethene, carbon tetrachloride, benzene, 1,2-dichloroethane, trichloroethene, and tetrachloroethene exceed TCLP regulatory limits. In its contributing sample **1705002-18**, vinyl chloride and carbon tetrachloride exceed TCLP regulatory limits, while in contributing sample **1705002-20**, vinyl chloride, 1,1-dichloroethene, carbon tetrachloride, benzene, 1,2-dichloroethane, trichloroethene and tetrachloroethene, reporting limits exceed TCLP regulatory limits. The high reporting limits are the unavoidable consequence of the limited mass of the filtrate available for methanol filtration of 1705002-18 (0.8 g, well below the 5 g required by the procedure), as well as a moderately high dilution required to keep 2-butanone on scale in 1705002-20.

This project encompasses work orders (WO's) 1705002, 1705003 and 1705003. Hard copy of all QC data and other supporting information for both WO1705003 and WO1705004 are filed at CRL under WO 1705002.

Notes and Definitions

- R Rejected
- L The identification of the analyte is acceptable; the reported value may be biased low. The actual value is expected to be greater than the reported value.
- K The identification of the analyte is acceptable; the reported value may be biased high. The actual value is expected to be less than the reported value.
- J The identification of the analyte is acceptable; the reported value is an estimate.
- B Analyte concentration is < 5x that in the associated method blank(s); this concentration may be a high-bias estimate.
- (SURR) Associated surrogate recovery criteria not met for this analyte
- (MS) Matrix spike recovery criteria not met for this analyte
- (IS) Internal standard criteria not met for this analyte
- (H) Holding time exceeded for sample preparation and/or analysis; Target analyte concentrations and/or reporting limits may not be accurate
- (CCV) Continuing calibration verification criteria not met for this analyte
- U Not Detected
- NR Not Reported
- Q QC limit Exceeded

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION 5 CHICAGO REGIONAL LABORATORY
536 SOUTH CLARK STREET
CHICAGO, ILLINOIS 60605

Date: 7/13/2017

Subject: Review of Region 5 Data for Mid America Steel Drum, Inc.

To: RCRA, LCD, US EPA Region 5
77 West Jackson Boulevard
Chicago, IL 60604

From: Greg Mitsakopoulos, Chemist
US EPA Region 5 Chicago Regional Laboratory

The data transmitted under this cover memo successfully passed CRL's data review procedures as documented in the current Quality Management Plan and applicable Standard Operating Procedures. In accordance with the EPA QA/G-8 *Guidance on Environmental Data Verification and Data Validation* and the U.S. EPA Region 5 RMD QMP, CRL performs data verification on all the data generated internally. CRL does not perform data validation or quality assessment procedures.

This report was reviewed and the information provided herein accurately represents the analysis performed.

X Greg Mitsakopoulos 7/13/17

Please contact the analyst with any technical report issues, Robert Thompson at (312)-353-9078 for sample project concerns, and Sylvia Griffin at (312)-353-9073 with data transmittal questions. Thank you.

Attached are Results for: Mid America Steel Drum, Inc.

Analysis Case Narrative

General Information

This narrative pertains to the ICP-AES analysis of TCLP samples for arsenic, barium, cadmium, chromium, lead, silver, and selenium. All holding times were met. Designated analyst Greg Mitsakopoulos may be reached at (312) 353-0377. The raw data are to be filed under work order 1705002.

work	TCLP ICP	received
<u>order</u>	<u>count *</u>	<u>on</u>
1705002	8	5/5/17
1705003	7	"
1705004	4	"

* The count of samples that underwent analysis is shown. TCLP metals tests for a few submitted samples were cancelled based on CRL observations on sample nature with respect to feasibility of testing and with consultation with the client.

<u>process</u>	<u>SOP</u>
TCLP extraction	Gen019 v. 5 (SW-846: 1311)
sample digestion	Metals025 v. 3 (based on EPA Method 200.2)
analysis	Metals003 v. 6 (based on EPA Method 200.7 and 6010D)

Matrix spike volumes were adjusted in the electronic bench sheet record to account for the dilutions in the digestion, so recovery calculations would be correct in terms of the undiluted TCLP extract.

Sample Analysis and Results

The data reported herein meets the requirements referenced in the SOP(s) used for analysis and any laboratory specifications stated in the "Land and Chemicals Division Generic Quality Assurance Project Plan for Field Sampling Events at Mid-America Steel Drum, Inc.", dated April 19, 2017.

The original hard copies of the TCLP preparation are in the data package for the SVOCs.

TCLP extraction preparation

TCLP extracts were prepared by analysts D. Kleinmaier, T. Strock, A. Wroble, and this analyst. TCLP preparation was quite challenging, as some of the sample characteristics varied from powders, to viscous multiphase systems, to non-aqueous components, and from highly acidic to highly basic. Limited amounts of sample were available to a procedure that requires more, the more complex the sample.

Project: Mid America Steel Drum, Inc.
Project Number: MASD 05-04-17
Project Manager: Jamie Paulin

Reported:
Jul-13-17 12:07

Most of the reported results represent the (complete) TCLP extract, since they originated from method-defined 100% solid or 100% liquid samples, or, the resultant TCLP phases were proportionally added together. But, it was not possible to leach the solids for four of the samples defined by the TCLP procedure to contain greater than 0.5% solids to undergo leaching. Thus, only first-filtrate results are reported for 1705002-03, 1705003-01, 1705003-03, and 1705003-06. Since all TCLP ICP metals were below reporting limits in the first-filtrates, no attempt was made to mathematically treat these with hypothetical dilutions of leachates. This is sound because the application of a dilution factor to a result that is below reporting limit is still a result below reporting limit.

Preservation of TCLP extracts

Four of the TCLP extracts were not preserved with acid before digestion due to one or more of the following reasons:

- * The expected amount of acid would significantly change the sample matrix
- * The sample is very basic and precipitation or violent reaction might occur
- * Field information and lab observations were such that the sample is expected to be mostly or totally non-aqueous, and thus a pH based on aqueous calibration standards does not make sense
- * The TCLP procedure and the amount of sample submitted to the lab resulted in a limited amount of extract to be shared with the entire lab; some analyses cannot use acid-preserved extracts

Per SOP Gen019, unpreserved extracts were held under refrigeration at 4 degrees C or less until digestion. Unpreserved extracts are indicated on the digestion bench sheets.

Digestion and dilutions of TCLP extracts; analysis

To maximize the effectiveness of the digestion acids and to protect the trace-level ICP instrument, TCLP extracts of field samples were accordingly processed with dilutions in the digestion.

The TCLP process resulted in extracts with a leached fraction for twelve of the samples. A twenty-fold dilution was selected, since the leaching process is in effect a dilution of the field sample. This dilution level still allows the regulatory limits of all of the TCLP ICP metals to be reported. Regulatory levels of these metals were not found.

For the remaining seven samples, the extract was a filtrate of unleached sample. This meant these were probably of a concentrated nature, yet the established digestion and analysis methods are built for aqueous environmental samples. It was anticipated based on this, along with field information and lab observations, these would be difficult to digest and analyze without harm to the instrument or analyst, and thus were digested at a dilution factor of one thousand. None of the TCLP ICP metals were found at the resultant reporting limits.

In the raw instrument data for sample 1705002-05 cadmium was more negative than the reporting limit. Since this effect was not seen in the alternate cadmium line, the "U" result will stand as-is.

Quality Control

All quality control (QC) audits for the study analytes were within CRL's limits or did not result in qualification of the data, except for the following:

Extraction Fluid Blank: Limit = \pm method detection limit (MDL). The extraction fluid blank from 5/18/17 had 0.031 mg/L barium (MDL 0.0091 mg/L barium). Samples processed with this extraction fluid, with less than ten times the blank amount are flagged "K" for potential high bias: 1705003-04, 1705003-07, 1705004-07, and 1705004-08.

Laboratory Fortified Blank (BS): recovery limit = $100\% \pm 15\%$. Silver recovery in B17E050-BS1 was 52%. It's evident that an error was made when preparing the blank spike sample. No field samples will be flagged, as none are above the silver reporting limit, the matrix spike audits passed, and the instrument quality control audits passed.

Field Duplicates: CRL does not have audit limits for field duplication. But for information, the field samples have been compared to the audit limits for laboratory duplicates: Relative Percent Deviation (RPD) $\leq 20\%$, or an absolute difference below method detection limit (MDL), when near MDL. With respect to TCLP ICP metals above reporting limits- barium in this case- the field-identified pair 1705004-09 and 1705004-10 showed good agreement. For the field-identified pair 1705002-10 and 1705002-11, none of the TCLP ICP metals were above reporting limits.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

REGION 5 CHICAGO REGIONAL LABORATORY
536 SOUTH CLARK STREET
CHICAGO, ILLINOIS 60605

Date: 7/20/2017

Subject: Review of Region 5 Data for Mid America Steel Drum, Inc.
To: RCRA, LCD, US EPA Region 5
77 West Jackson Boulevard
Chicago, IL 60604
From: Francis Awanya, Chemist
US EPA Region 5 Chicago Regional Laboratory

The data transmitted under this cover memo successfully passed CRL's data review procedures as documented in the current Quality Management Plan and applicable Standard Operating Procedures. In accordance with the EPA QA/G-8 *Guidance on Environmental Data Verification and Data Validation* and the U.S. EPA Region 5 RMD QMP, CRL performs data verification on all the data generated internally. CRL does not perform data validation or quality assessment procedures.

This report was reviewed and the information provided herein accurately represents the analysis performed.

X Francis A. Awanya 7/20/2017

Please contact the analyst with any technical report issues, Robert Thompson at (312)-353-9078 for sample project concerns, and Sylvia Griffin at (312)-353-9073 with data transmittal questions. Thank you.

Analysis Case Narrative

General Information

Samples for the above project were received at the Chicago Regional Laboratory on 5/5/2017. The samples were logged in the CRL LIMS for Ignitability by Setaflash on 5/8/2017 under Work Order Numbers 1705002, 1705003, and 1705004 respectively. Twenty-four (24) of those samples were analyzed for Ignitability by Setaflash using Standard Operating Procedure (SOP) CRL Document# AIG048A Version# 4 (Based on EPA SW-846 Method 1020B). Samples 1705002-13 (Field Sample Name OCS-12), 1705004-09 (Field Sample Name SFS10), and 1705004-10 (Field Sample Name SFS10 Dup) are solids and were not analyzed. Sample 1705002-05 (Field Sample Name OCS-05) solidified and similarly could not be analyzed. Samples 1705003-03 (Field Sample Name CS-03), 1705003-07 (Field Sample Name CS-07), and 1705004-01(Field Sample Name SFS01) could not be analyzed for Ignitability by Setaflash because the containers were empty. The designated analyst is Francis Awanya. Francis can be reached at 312-886-3682. Other pertinent information and dates are provided in the final analysis report. Holding time does not apply to these samples.

Supporting data archived under Work Order Number: 1705002.

Sample Analysis and Results

The lowest attainable temperature was reported for samples 1705002-04 (Field Sample Name OCS-04) and 1705002-09 (Field Sample Name OCS-09). Both samples clearly flashed at the reported temperatures. But the tests could not be conducted at 9 °F lower than the reported flash temperatures because the target values were below what could be read on the instrument thermometer and the practical limit was reached.

A result is reported as No Flash (NF) when it is established that the sample is not ignitable at or below 140 °F. The data reported herein meets the requirements of the CRL analytical SOP used for analysis and the "Land and Chemicals Division Generic Quality Assurance Project Plan for Field Sampling Events" at Mid-America Drum Company, Inc. The Quality Assurance Project Plan (QAPP) is archived in the CRL share drive as "Mid America Steel Drum QAPP".

Quality Control

All required quality control criteria for the laboratory, method, and system performance audits were evaluated and determined to be within the CRL's QC limits.

Project Number: MASD 05-04-17
Project Manager: Jamie Paulin

Reported:
Jul-21-17 13:05

Analysis Case Narrative

General Information

Samples for the analysis of Corrosivity were received at the Chicago Regional Laboratory (CRL) on May 5, 2017. The samples were assigned across three CRL work orders, which are reported together in this report. The samples met the preservation requirement upon receipt. There is no mandatory holding time defined in the reference method. The designated analyst, Colin Breslin, can be reached at 312-886-2912.

The samples were prepared and analyzed according to CRL SOP AIG003 Version #4 (based on SW-846: 9040C).

Note: Supporting data are archived with work order 1705002.

Sample Analysis and Results

The data reported herein meets the requirements of the CRL analytical SOP used for analysis and any laboratory specifications stated in the Land and Chemicals Division, Generic Quality Assurance Project Plan, dated April 19, 2017, for the site Mid-America Steel Drum, Inc. The QAPP is saved on the CRL share drive with file name: Mid America Steel Drum QAPP.pdf.

Samples were screened for water content. When the water content did not meet the method requirements that the aqueous phase constitute at least 20% of the sample, the samples were not analyzed for Corrosivity. Water content analysis was reported separately.

Note: As of this report, additional samples still require water content screening before performing Corrosivity analysis. Additional Corrosivity results may still be reported.

Sample with CRL identification number 1705002-05 solidified and was not amenable to testing for Corrosivity.

The result for the sample with CRL identification number 1705003-08 was 13.84 pH units, and a duplicate analysis confirmed the result at 13.85 pH units. The instrument was calibrated with pH buffers at 7, 10, and 12. The calibration was confirmed with second source check standards at 7, 8, 10, 12.45, and 13 pH units. All confirmation buffers were recovered within the allowable limit of ± 0.1 pH units. The reported result was greater than the highest confirmation buffer, however, no qualifiers were applied to the final result because the instrument was shown to be in control at pH 13. Therefore, the result was reported with a high degree of confidence to have exceeded pH 13, and is considered to be accurate and precise at the reported concentration of 13.8 pH units.

Quality Control

All Quality Control (QC) audits were within CRL limits for the requested analytes or did not result in qualification of the data.

Note: The QC audit for a continuing calibration check at pH 1 (LIMS Sequence ID 17F1603-CCV2) was recorded at 1.114 pH units, which slightly exceeded the allowable limit ± 0.1 pH units at a difference of 0.114 pH units. However, the reportable precision of this SOP is to one decimal place and the QC audit passed at this level of precision. Therefore, no impact or qualifier was applied for sample with CRL LIMS ID 1705003-05, which was analyzed with this calibration check. Also, the result for 1705003-05 was 2.4 pH units and the instrument checks met all QC limits at that level.

Note: The QC audit for a continuing calibration check at pH 12.45 (LIMS Sequence ID 17F1604-CCV2) was recorded at 12.33 pH units, which slightly exceeded the allowable limit ± 0.1 pH units at a difference of 0.12 pH units. However, the reportable precision of this SOP is to one decimal place and the QC audit passed at this level of precision. Therefore, no impact or qualifier was applied for sample with CRL LIMS ID 1705004-07, which was analyzed with this calibration check. The result for 1705004-07 was 12.56 pH units and its duplicate result was 12.57 pH units. Furthermore, calibration checks at pH 13 (LIMS ID 17F1604-CCV3) were recovered within their QC limits. All other instrument checks met all QC limits. Therefore, the result for sample 1705004-07 was reported with a high degree of confidence that the result exceeds 12.5 pH units, and is considered to be accurate and precise at the reported concentration of 12.6 pH units.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION 5 CHICAGO REGIONAL LABORATORY
536 SOUTH CLARK STREET
CHICAGO, ILLINOIS 60605

Date: 7/25/2017

Subject: Review of Region 5 Data for Mid America Steel Drum, Inc.

To: RCRA, LCD, US EPA Region 5
77 West Jackson Boulevard
Chicago, IL 60604

From: Colin Breslin, Chemist
US EPA Region 5 Chicago Regional Laboratory

The data transmitted under this cover memo successfully passed CRL's data review procedures as documented in the current Quality Management Plan and applicable Standard Operating Procedures. In accordance with the EPA QA/G-8 *Guidance on Environmental Data Verification and Data Validation* and the U.S. EPA Region 5 RMD QMP, CRL performs data verification on all the data generated internally. CRL does not perform data validation or quality assessment procedures.

This report was reviewed and the information provided herein accurately represents the analysis performed.

X Col Breslin 7/25/2017

Please contact the analyst with any technical report issues, Robert Thompson at (312)-353-9078 for sample project concerns, and Sylvia Griffin at (312)-353-9073 with data transmittal questions. Thank you.

Attached are Results for: Mid America Steel Drum, Inc.

Analysis Case Narrative

General Information

Samples for the analysis of Corrosivity were received at the Chicago Regional Laboratory (CRL) on May 5, 2017, which requires that samples be 20% aqueous, therefore, Water Content determination was required to supplement the Corrosivity analysis. The Corrosivity results were reported separately. The samples were assigned across three CRL work orders, which are reported together in this report. The samples met the preservation requirement upon receipt. There is no mandatory holding time defined in the reference method. The designated analyst, Colin Breslin, can be reached at 312-886-2912.

The samples were prepared and analyzed according to CRL SOP AIG015 Version #3 (based on SW-846: 9000).

Note: Supporting data are archived with work order 1705002.

Sample Analysis and Results

The data reported herein meets the requirements of the CRL analytical SOP used for analysis and any laboratory specifications stated in the Land and Chemicals Division, Generic Quality Assurance Project Plan, dated April 19, 2017, for the site Mid-America Steel Drum, Inc. The QAPP is saved on the CRL share drive with file name: Mid America Steel Drum QAPP.pdf.

Sample with CRL identification number 1705002-05 solidified and was not amenable to testing for Water Content or Corrosivity because the sample turned solid upon handling and could not be dispensed into the testing apparatus.

Due to the extremely difficult sample matrices an exceptional amount of reagent was required for Water Content determinations. Additional reagent was ordered but vendor supplies were back ordered. Addition samples still require Water Content determination and will be reported as soon as the analyses are completed. This report contains the results that have been determined so far. The following list summarizes the status of Water Content and Corrosivity analyses:

Reported:
Jul-25-17 07:58

Sample with CRL identification number 1705002-01 was reported to have a water content of 100.8%. Its duplicate result was 95.9% water content, which was within the quality control limit of 10% relative percent difference (RPD) at 4.98% RPD. Therefore, a result which was greater than 100% was likely due to slight variation in the balance, titrant volume dispensed, or minor fluctuation in electrode response. Any of which could contribute a slight bias in measurement error to exceed 100%. Therefore, sample 1705002-01 was considered to have nearly 100% water content, which certainly exceeds the 20% threshold for making a valid measurement of Corrosivity. The result remains reported as 100.8% water content.

Quality Control

All Quality Control (QC) audits were within CRL limits for the requested analytes or did not result in qualification of the data, except as follows:

Batch QC Duplicates:

Sample with CRL identification number 1705002-04 was reported at 0.5% water content and its duplicate result was 0.34% water content, which exceeded the QC limit of 10% relative percent difference (RPD) at 38.1% RPD. Sample results at and slightly below the reporting limit are inherently more uncertain. Therefore, the sample result for 1705002-04 was reported with a data qualifier flag as estimated. The result is considered valid that the sample result was below the 20% aqueous threshold for Corrosivity, which was not measured.

Sample with CRL identification number 1705003-05 was reported at 27.3% water content and its duplicate result was 31.9% water content, which exceeded the QC limit of 10% relative percent difference (RPD) at 15.6% RPD. Therefore, the sample result for 1705003-05 was reported with a data qualifier flag as estimated. The result is considered valid that the sample result was above the 20% aqueous threshold for Corrosivity determination.

Chicago, IL 60604
From: Troy Strock, Chemist
US EPA Region 5 Chicago Regional Laboratory

The data transmitted under this cover memo successfully passed CRL's data review procedures as documented in the current Quality Management Plan and applicable Standard Operating Procedures. In accordance with the EPA QA/G-8 *Guidance on Environmental Data Verification and Data Validation* and the U.S. EPA Region 5 RMD QMP, CRL performs data verification on all the data generated internally. CRL does not perform data validation or quality assessment procedures.

This report was reviewed and the information provided herein accurately represents the analysis performed.

ANALYSIS CASE NARRATIVE

Analyst Phone number: 312.353.8363

General Information

25 waste samples were received on 5/05/2017 for preparation by the toxicity characteristic leaching procedure (TCLP) and analysis of TCLP extracts for semivolatile organic chemicals. The designated analyst for these samples was Troy Strock, and he can be reached at (312) 353-8362. Method 1311 provides holding times from sample collection to TCLP preparation and from TCLP preparation to extraction for semivolatile organics in order to demonstrate a waste is non-hazardous, and these holding times were not met for some of the field samples. Data for samples prepared past these method-defined holding times cannot be used to demonstrate samples are non-hazardous, but any TCLP extract concentrations exceeding the regulatory limits may be used to demonstrate samples are hazardous. Refer to the 'quality controls' section below for more details.

Samples were prepared using Chicago Regional Laboratory (CRL) Standard Operating Procedure (SOP) GEN019 V5 (based on SW-846 Method 1311). Most TCLP extracts were prepared by equilibrium liquid-liquid extraction SOP MS026 V2 (based on SW-846 reference methods 3511 and 8270D). TCLP extracts (or fractions thereof) that were immiscible with water or were otherwise very viscous were prepared by solvent dilution. The solvent dilution procedure (based on SW-846 reference method 3580A) is not included in MS026 V2, but the procedure used is summarized in pen and ink change #10389, which is included in the data package. TCLP extracts were analyzed for the subset of semivolatile organic chemicals listed in 40 CFR Part 261.24, and the data were evaluated against the action levels listed there. Data review was performed according to the guidelines described in CRL SOP GEN010 Version 2.

Supporting data for work orders 1705003 and 1705004 can be found in the folder for work order 1705002.

Sample Analysis and Results

TCLP extracts that were not miscible with water (laboratory sample IDs 1705002-02, -08, -09, 1705003-02, and 1st filtrates of 1705002-04 and -12) or were very viscous (laboratory sample IDs 1705003-01 and -03) were prepared by solvent dilution in batch B17F036. The rest of the TCLP extracts were prepared by equilibrium liquid-liquid extraction in batches B17E048 and B17E049.

None of the semivolatile organic TCLP target analytes were measured above the regulatory levels listed in 40 CFR Part 261.24, Table 1, in any of the samples submitted for this project.

3+4-methylphenol (synonyms: m-cresol and p-cresol, Chemical Abstracts Service numbers 108-39-4 and 106-44-5) were measured above the reporting limit (RL) in TCLP extracts of laboratory sample IDs 1705004-07,

Reported:
Jul-21-17 12:11

1705004-08, 1705004-09, and 1705004-10, but their concentrations were well below the regulatory limit. 2-methylphenol (synonym: o-cresol, Chemical Abstracts Service number 95-48-7) was present in the 1st filtrate of laboratory sample ID 1705002-08, but the concentration was just under the reporting limit of 110 mg/L assigned to this analyte by solvent dilution, which is also less than the regulatory level.

For the equilibrium liquid-liquid micro-extraction procedure, some samples are reported from dilutions due to the nature of the sample matrices tested, which raised the corresponding RLs for some target analytes to above their respective regulatory limits. For the solvent dilution procedure, RLs were on the order of 100 mg/L (nominal) for all target analytes except 3+4-methylphenol (200 mg/L) and pentachlorophenol (250-2500 mg/L), which are above the TCLP regulatory limits for many target analytes.

Results for TCLP extracts of two samples, 1705002-04 and 1705002-12, are derived from separate analysis of the 1st and 2nd filtrates, which were not miscible with one another. Results from analysis of the individual phases of these samples are reported as separate laboratory sample IDs. RLs assigned to target analytes in these two field samples are volume weighted averages of the RLs assigned for separate analysis of the individual phases. Surrogate recoveries for these samples are reported in the analytical results for the individual phases.

The data reported herein meet the requirements referenced in the SOP(s) used for sample preparation and analysis and any laboratory specifications stated in the FSAP, with exceptions noted in the quality control section below.

Quality Control

Please refer to the LIMS report for descriptive qualifiers added by analyte, which identify both the QC criteria that were not met and the expected impact on the reported data. The key at the end of the report provides a description of each qualifier code. Any target analytes or surrogates that did not meet the acceptance criteria listed in the report are also marked with a 'Q'. Below is a summary of the QC parameters that did not meet the acceptance criteria in the SOP.

Changes from the preliminary report:

This narrative was condensed and clarified with regard to:

- 1) The lack of an approved IDOC study completed for the solvent dilution preparation procedure prior to analysis of samples in preparation batch B17F036;
- 2) Reporting results for the 1st filtrate of laboratory sample ID 1705002-08 as the TCLP extract;
- 3) Non-conformances identified during TCLP preparation and analysis of TCLP extracts for semivolatile organics, recorded as Qualtrax ID #'s 10652 and 10851 and referenced in this narrative.

TCLP preparation:

Laboratory sample IDs 1705002-03, 1705002-09, 1705003-01, 1705003-02, and 1705003-03 were treated as

Project Number: MASD 05-04-17
Project Manager: Jamie Paulin

Reported:
Jul-21-17 12:11

100% liquid samples with regard to TCLP preparation in spite of having dry solids contents > 0.5%. These samples filtered readily and were clear single-phase liquids, and no particulates remained on the filters from these samples after filtration, so extraction fluid determination could not be performed on these samples, which is required by the reference method prior to leaching the solid fraction.

Laboratory sample ID 1705002-08 was a viscous single-phase opaque liquid that filtered very slowly, and although the solids content was low, it was still > 0.5% dry solids. Any solids remaining on the filter were incorporated in the pores of the filter and could not be separated from the filter material. Since 5 g of solids was not obtained during liquid-solid separation to use for the extraction fluid determination step in SW-846 Method 1311, the solid fraction of this sample could not be leached.

Laboratory sample ID 1705003-06 was a viscous single-phase opaque liquid that clogged the filter during liquid/solid separation step of TCLP preparation after about 50% of the initial sample passed through the filter and therefore generated a solid fraction. However, the solid fraction remaining in the filtration apparatus was a liquid that was difficult to quantitatively transfer from the filtration apparatus to a leaching vessel. Since the 1st filtrate of this sample contained no identifiable semivolatile organic TCLP target analytes, there was no indication that leaching and analysis of the solid fraction of this sample would have produced a regulatory exceedance.

Holding times:

According to SW-846 Method 1311, data generated from samples that exceeded holding times from sample collection to TCLP extraction (14 days for semivolatile organics) or TCLP extraction to preparative extraction (7 days for semivolatile organics) cannot be used to demonstrate a material is non-hazardous. All samples that exceeded these holding times are qualified in the report. Holding time exceedances are documented in a non-conformance report, Qualtrax ID # 10851.

Instrument performance check:

For samples preceded by an instrument performance check with a pentachlorophenol tailing factor >2, the pentachlorophenol RL was raised in the samples to the CCV concentration, at which level it was qualitatively identifiable in both CCVs bracketing the samples. An additional qualifier is added for pentachlorophenol when it did not meet the CCV criteria. All other acidic and basic target analytes were qualitatively identifiable and were within $\pm 30\%$ of their expected concentrations in a standard analyzed at the (nominal) RL in the same 12-hour interval except in one case for 2,4,6-trichlorophenol (measured concentration was 30.4% low). The 2,4,6-trichlorophenol RL was qualified in samples that referenced the preceding instrument performance check.

Continuing calibration verification (CCV):

Target analytes are qualified in samples if they were bracketed by a CCV that did not meet the SOP acceptance criteria. Pentachlorophenol data was qualified frequently in samples for this project due to not meeting the CCV criteria.

Project: Mid America Steel Drum, Inc.
Project Number: MASD 05-04-17
Project Manager: Jamie Paulin

Reported:
Jul-21-17 12:11

Chromatographic resolution of structural isomers:

3- and 4-methylphenol are not chromatographically separable under the conditions used for this analysis, so they are reported as a combination of these coeluting isomers. In the matrix spike QC samples B17F036-MS3 and -MSD3, 2,4,6-trichlorophenol and 2,4,5-trichlorophenol were not chromatographically separable and appeared as one chromatographic peak.

Internal standards:

Target analytes are qualified in samples when their associated internal standards were not within 50-200% of the preceding mid-point initial calibration standard or CCV standard (whichever was analyzed more recently).

Reporting limit (RL) verification and blank spike (LCS) batch QC samples:

Target analytes that were qualitatively identifiable but were not recovered within the acceptance range at the (nominal) target analyte RL or in the LCS are qualified in all samples in the preparation batch.

NOTE: An initial demonstration of capability study has not been completed for the solvent dilution preparation procedure, which is how the laboratory establishes default target analyte RLs for a preparation and analysis procedure. In preparation batch B17F036, all target analytes except pentachlorophenol were qualitatively identifiable and recovered acceptably in the RL verification QC sample B17F036-MRL2 (prepared at 50 ug/L nominal concentration). Pentachlorophenol was qualitatively identifiable in the LCS samples in this batch (B17F036-BS1 and -BSD1, prepared at a nominal concentration of 250 ug/L), but recovery was below the lower control limit of 70% listed in pen and ink change 10389. The nominal RL assigned to pentachlorophenol in the field samples in this preparation batch was set to 250 ug/L except when the pentachlorophenol tailing factor criteria was not met in the instrument performance check, in which case the nominal RL was set to 2500 ug/L (equivalent to the CCV level).

Matrix spike QC samples:

Target analytes are qualified in source samples when they are not recovered within their compound-specific acceptance ranges, unless their recoveries are above the upper control limit and they are not found in the source sample.

NOTE: Pentachlorophenol was not recovered in matrix spikes of laboratory sample ID 1705002-05 (reported as B17E049-MS1/MSD1) or 1705003-01 (reported as B17F036-MS3/MSD3), and nitrobenzene was not recovered in the matrix spike of 1705002-02 (reported as B17F036-MSD1). These target analytes were not found in the source samples, so their RLs were raised to the (nominal) matrix spike level in the source samples and qualified 'rejected' to indicate they cannot be reliably reported as not present at the prepared MS/MSD concentration.

Surrogates:

Surrogate recoveries are evaluated by sample. If more than 1 of 3 acid fraction surrogates (2-fluorophenol,

Project Manager: Jamie Paulin

Reported:
Jul-21-17 12:11

phenol-d5, and 2,4,6-tribromophenol) or neutral fraction surrogates (nitrobenzene-d5, 2-fluorobiphenyl, and terphenyl-d14) does not meet the acceptance criteria, the associated target analytes are qualified. If recovery of pyridine-d5 did not meet the acceptance criteria, the data for pyridine is qualified. If surrogate recovery is above the upper acceptance limit and none of the associated target analytes are found in the sample, no data qualifiers are added.

NOTE: No surrogate recoveries are reported for laboratory sample IDs 1705002-03 or 1705003-06 due to co-extracted non-target matrix interferences that prevented the extracts from being successfully analyzed at the default extract volume in the SOP.

Preparation batch B17F036 initial demonstration of capability and non-conformances:

An initial demonstration of capability (IDOC) that complies with CRL Quality Management Plan requirements has not been completed for the solvent dilution preparation procedure at the time these samples were analyzed. No non-conformance report was created, because CRL laboratory management and the project manager were made aware of this through pen and ink change #10389. Pentachlorophenol performance was variable depending on the sample, but performance of the other target analytes generally met expectations.

Surrogate recoveries in QC sample B17F036-MS3 were around a factor of 10 higher than in the field sample 1705003-01 and matrix spike duplicate B17F036-MSD3, consistent with having been spiked with ten times more of the surrogates spiking solution than the field sample or matrix spike duplicate. Target analyte recoveries in B17F036-MS3 and -MSD3 were similar, and non-target analytes in these samples were consistent between these replicates, which supported the assertion that high surrogate recovery in this QC sample was due to a preparation error. The non-conformance is documented in Qualtrax ID # 10851.

QC sample ID B17F036-MS1 is not reported due to a suspected preparation error (surrogates were recovered acceptably, but no target analytes were identified in this QC sample). This non-conformance is documented in Qualtrax ID # 10851.

REGION 5 CHICAGO REGIONAL LABORATORY
536 SOUTH CLARK STREET
CHICAGO, ILLINOIS 60605

Date: 7/18/2017

Subject: Review of Region 5 Data for Mid America Steel Drum, Inc.
To: RCRA, LCD, US EPA Region 5
77 West Jackson Boulevard
Chicago, IL 60604
From: Colin Breslin, Chemist
US EPA Region 5 Chicago Regional Laboratory

The data transmitted under this cover memo successfully passed CRL's data review procedures as documented in the current Quality Management Plan and applicable Standard Operating Procedures. In accordance with the EPA QA/G-8 *Guidance on Environmental Data Verification and Data Validation* and the U.S. EPA Region 5 RMD QMP, CRL performs data verification on all the data generated internally. CRL does not perform data validation or quality assessment procedures.

This report was reviewed and the information provided herein accurately represents the analysis performed.

X Colin Breslin 7/18/2017

Please contact the analyst with any technical report issues, Robert Thompson at (312)-353-9078 for sample project concerns, and Sylvia Griffin at (312)-353-9073 with data transmittal questions. Thank you.

Analysis Case Narrative

General Information

Samples for the analysis of total mercury in TCLP sample extracts by cold vapor atomic absorption (CVAA) were received at the Chicago Regional Laboratory (CRL) on May 5, 2017. The samples were assigned across three CRL work orders, which are reported together in this report. The samples met the preservation requirement upon receipt. The samples were analyzed within the 28 day hold time after TCLP extraction. The designated analyst, Colin Breslin, can be reached at 312-886-2912.

The samples were prepared and analyzed according to CRL SOP AIG044E Version #3 and CRL SOP AIG044D Version #5 (based on EPA 245.1/SW-846: 7470A). Samples that were amenable to the automated preparation and analysis procedure were analyzed by AIG044E Version #3. Samples that required dilution and manual preparation were analyzed by AIG044D Version #5.

Note: Supporting data are archived with work order 1705002.

Sample Analysis and Results

The data reported herein meets the requirements of the CRL analytical SOP used for analysis and any laboratory specifications stated in the Land and Chemicals Division, Generic Quality Assurance Project Plan, dated April 19, 2017, for the site Mid-America Steel Drum, Inc. The QAPP is saved on the CRL share drive with file name: Mid America Steel Drum QAPP.pdf.

Sample results that required dilution are noted in the report as having a dilution greater than one. The dilution factors have already been applied to the final results and reporting limits.

Quality Control

All Quality Control (QC) audits were within CRL limits for the requested analytes or did not result in qualification of the data.
