Re: Proposed 2017 Illinois Ambient Air Monitoring Network Plan

Michael
Dear Mr. Compher:

Enclosed is the 2017 Illinois Ambient Air Monitoring Network Plan.

Consistent with the Part 58 rules, the proposed 2017 Network Plan was posted on the Illinois EPA website for a 30-day public review period. Minor comments received on the Network Plan have been addressed directly with the commenters.

If you have any questions or wish to discuss this matter further, please contact me directly.

Sincerely,

A handwritten signature in blue ink that reads "David E. Bloomberg".

VOC	Volatile Organic Compounds

Introduction

In 1970, Congress enacted the Clean Air Act (CAA), empowering the United States Environmental Protection Agency (U.S. EPA) to develop and implement National Ambient Air Quality Standards (NAAQS) for pollutants shown to threaten human health.

NAAQS exist for six criteria pollutants – carbon monoxide (CO), ozone (O_3), lead (Pb), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter with a diameter less than or equal to 10 micrometers (PM_{10}), and fine particulate matter ($PM_{2.5}$). There are primary and secondary NAAQS. Primary standards protect public health, whereas secondary standards protect public welfare including the environment.

A predominant goal of the air monitors within Illinois' network is to collect data with which to assess compliance with the NAAQS. A listing of these NAAQS calculations and contributions can be found at <http://www3.epa.gov/ttn/naaqs/criteria.html>.

Illinois has designed its ambient air monitoring network to provide timely air pollution data to the public, support compliance with ambient air quality standards and emissions strategy development, and support air pollution research studies. Data gathered from the Illinois EPA's monitoring network is used to produce a daily Air Quality Index (AQI) report, compile daily air quality forecast reports, support short- and long-term health risk assessments, identify localized health concerns, and track long-term trends in air quality that could potentially threaten Illinois citizen's quality of life.

The Illinois air monitoring network includes monitors for the six criteria pollutants: CO, O_3 , Pb, NO_2 , SO_2 , PM_{10} , and $PM_{2.5}$. The Illinois air monitoring network meets or, in most cases, exceeds the applicable minimum network requirements.

Monitor siting takes into consideration: peak (the highest concentration of pollution in a given area), population (presence of pollutants in areas with high population densities), source (pollution resulting from significant sources or source categories), background (general pollutant levels), and transport (extent of regional pollutant transport between populated areas). Federal regulations prescribe requirements for monitor and probe siting to ensure that the ambient air quality data accurately is representative. The criteria for the placement and operation of each monitor and probe vary. Site surveys ensure that each requirement is satisfied.

Federal regulations require each State to submit to U.S. EPA an air monitoring network plan annually for the prospective year. Additionally, a five-year network assessment must be completed by U.S. EPA Region 5 monitoring organizations. The last five-year network assessment was completed in 2015 and found the criteria pollutant monitoring network was adequate in meeting U.S. EPA's minimum criteria. The annual network plans take into consideration findings of these assessments. The annual network plan provides a description of the monitoring network for each criteria pollutant including proposed changes. The air monitoring network plan is subject to public review and comment prior to its submission to the U.S. EPA.

Monitoring Designations

The following designations describe the various types of monitors at the sites within Illinois' air monitoring network:

- **NCore** - National Core multi-pollutant monitoring station. Illinois is required by federal regulations to operate one NCore site, which includes monitors for CO, nitric oxide/reactive nitrogen (NO/NO_y), SO_2 , O_3 , PM_{10} , speciated $\text{PM}_{2.5}$, $\text{PM}_{2.5}$, $\text{PM}_{10-2.5}$, and Pb. Illinois operates an NCore site in Northbrook and provides support for the federal rural NCore site located in Bondville measuring $\text{PM}_{2.5}$.
- **Near-road** - Placed near busy roadways, near-road sites measure the peak hourly concentrations of NO_2 and sometimes CO or $\text{PM}_{2.5}$ in urban areas. Illinois EPA will operate two near-road locations, in Chicago and Lansing. These two sites are expected to start operating in 2016.
- **PAMS** - Photochemical Assessment Monitoring Station. In addition to monitoring of criteria pollutants, Illinois also participates in a regional Photochemical Assessment Monitoring Station (PAMS) network in the Chicago area that is part of the U.S. EPA approved "Alternate Plan for the Regional Lake Michigan PAMS Network." This regional PAMS network focuses on both the Milwaukee and Chicago areas that are classified as ozone nonattainment areas. These sites are dedicated to obtaining more information about ozone and its precursors. The Illinois sites participating in the 2016 regional PAMS network will include Schiller Park and Northbrook. Illinois' regional PAMS sites will collect and monitor some or all of the following: speciated volatile organic compounds (VOCs), carbonyls, NO/NO_y , O_3 , CO, and meteorological data in order to monitor potential threats of nonattainment. Recent changes to PAMS regulations will require enhanced VOC measurements, enhanced carbonyls or hourly formaldehyde measurements, a direct measure NO_2 monitor (true NO_2), and additional meteorological parameters in Northbrook. These additions are required to be implemented by June 2019.
- **SLAMS** - State or Local Ambient Monitoring Station. SLAMS monitoring is for comparison to the NAAQS.
- **SPM** - Special Purpose Monitor. The monitors in this category are included in the Agency network but do not apply toward the determination of area NAAQS compliance.

Monitoring Objectives

Monitoring objectives describe the various purposes of the monitors within Illinois' air monitoring network:

- **General Concentration (Background)** - These sites are positioned to measure the general background concentration of pollutants in an area.
- **Highest Concentration (Highest Conc.)** - These sites are located to determine the expected peak concentrations of pollutants in an area.
- **Population** - Located in areas categorized by high population density, these sites are used to determine the typical pollutant concentrations in a specific area.
- **Regional Transport (Transport)** - These sites are located to monitor the level of regional pollution transport from one area to the next.

- **Source-Oriented Source (Source)** - As certain sources contribute to pollution more significantly than others, source-oriented monitors are placed in order to identify the impact of these sources.

Spatial Scale Designations

Sites are not only characterized by type and by the objective, but also according to spatial scale. These scales are used to categorize siting areas and link them with the specific monitoring objectives. Spatial scales as outlined by the U.S. EPA include:

- **Micro** - Concentrations in air volumes associated with area dimensions ranging from several meters up to about 100 meters.
- **Middle** - Concentrations typical of areas up to several city blocks in size with dimensions ranging from about 100 meters to 0.5 kilometer.
- **Neighborhood** - Concentrations within some extended area of the city that has relatively uniform land use with dimensions in the 0.5 to 4.0 kilometers range.
- **Urban** - Overall, citywide conditions with dimensions on the order of four to 50 kilometers.
- **Regional** - A rural area of reasonably homogenous geography without large sources, extending from tens to hundreds of kilometers.

Sampling Methodology

Every ambient air monitor can be classified by a specific method number which identifies sample collection and analysis methods. A comprehensive list of these numbers can be found at: <http://www.epa.gov/ttn/amtic/files/ambient/criteria/reference-equivalent-methods-list.pdf>.

Federal regulations specify that monitoring methods used for comparison to the NAAQS must be Federal Reference or Equivalent Methods (FRM or FEM). Almost all monitors listed in Illinois' network plan use either FRM or FEM with only a few exceptions. Locations hosting continuous PM_{2.5} samplers solely for AQI purposes are not operated as FRM or FEM.

Quality Assurance

Guidance, policies, and federal regulations establish quality system requirements for data submitted to U.S. EPA. Currently, there are two Primary Quality Assurance Organizations under this network plan – the Illinois EPA and the Cook County Department of Environmental Control (CCDEC).

Proposed Network for 2017

Ozone

Illinois is required to operate a minimum of 14 O₃ monitoring sites across the state to meet SLAMS O₃ requirements. NCore requires the operation of one O₃ monitor year-round.

Additionally, 19 other O₃ monitors are operated for purposes of supporting the basic monitoring objectives of public data reporting, air quality mapping, compliance, and supporting air pollution research studies. In 2016, Illinois EPA operated 33 O₃ monitors. Four of these monitors will be part of the alternate PAMS sites – Braidwood, Schiller Park, Northbrook, and Zion.

Additionally, U.S. EPA operated three ozone monitors as part of the Clean Air Status and Trends Network (CASTNET). The number of ozone monitors will not change in 2017. However, the Jerseyville school district has contacted Illinois EPA indicating it can no longer accommodate monitoring equipment. An alternate ozone monitoring location off of the school property is being investigated. This change is expected to occur near the end of the 2016 ozone monitoring season.

Fine Particulate Matter (PM_{2.5})

Illinois is required to operate a minimum of 13 FRM or FEM PM_{2.5} monitors. NCore requires one continuous and one filter based PM_{2.5} monitor. One near-road monitoring site with one FRM or FEM PM_{2.5} monitor is also required. Illinois must operate at least one FRM or FEM PM_{2.5} site monitoring regional background and at least one FRM or FEM PM_{2.5} site to monitor regional transport. Additionally, 18 other PM_{2.5} monitoring sites are operated for purposes of supporting the basic monitoring objectives of public data reporting, air quality mapping, compliance, and supporting air pollution research studies. In 2016, 34 PM_{2.5} sites were operating in Illinois. In 2017, the number of PM_{2.5} sites will not change. Depending on funding availability, additional PM_{2.5} monitors may be switched from manual filter-based FRM samplers to continuous FEM samplers. The sites that have or will have FEM samplers under this plan are listed in Table 4. As discussed in the 2016 Network Plan, samplers that will switch to FEM continuous units this year include Northbrook, Knight Prairie, Jerseyville, Houston, Rock Island, and Braidwood. These are in addition to a new near-road FEM PM_{2.5} sampler in Chicago. For 2017, Cary, Champaign, Decatur, Elgin, Normal, and Peoria are targeted for FEM samplers.

As discussed under the ozone section, the Jerseyville school district has contacted Illinois EPA indicating it can no longer accommodate monitoring equipment. An alternate PM_{2.5} monitoring location off of the school property is being investigated. This change is expected to occur during the course of the 2016 monitoring season.

Illinois EPA is proposing to discontinue one PM_{2.5} speciation monitor in 2017. There are currently five speciation monitors across the State. These include supplemental speciation sites in Granite City, Northbrook, Chicago – Springfield Pump Station, and Naperville. An additional monitor in Chicago – ComEd is considered part of the national Speciation Trends Network (STN). Of the four Chicago Metropolitan Statistical Area monitors, the Naperville and Northbrook monitors have consistently measured some of the lowest PM_{2.5} concentrations below the NAAQS. Though only a partial three-year period exists to determine annual design values

for sites in Chicago, both Naperville and Northbrook are tied for the fourth lowest annual average concentrations in the speciation network (Table 1). Illinois EPA is proposing to discontinue the Naperville PM_{2.5} speciation monitor and retain the Northbrook monitor. The Northbrook monitor is part of the multipollutant NCore network. Keeping the PM_{2.5} monitor at this location will help further some of the objectives of the NCore network such as tracking long-term trends and their precursors.

Table 1. PM_{2.5} Averages

Site	2014 & 2015 Average
Naperville	9.7
Northbrook	9.7
Chicago-Com Ed	10.2
Chicago-Springfield	11.4
Granite City-Gateway	12.6

Additionally, Illinois EPA is proposing to change the ComEd and Northbrook speciation sampling schedules from 1-in-3 day to 1-in-6 day. On August 13, 2014, U.S. EPA submitted for publication in the Federal Register proposals to revise ambient monitoring and quality assurance requirements. U.S. EPA noted in this proposal the following: “The STN stations are currently required to sample on at least a 1-in-3 day frequency with no opportunity for flexibility. While the U.S. EPA firmly believes in the long-term importance of the STN stations to support the development of SIPs, modeling exercises, health studies, and the investigation of air pollution episodes and exceptional events, we do not believe that the current inflexibility with regard to sampling frequency is in the best interests of monitoring agencies, the U.S. EPA, or stakeholders... the U.S. EPA is proposing that a reduction in sampling frequency from 1-in-3 day be permissible for manual PM_{2.5} samplers at STN stations.” This U.S. EPA proposal became final on March 10, 2016. As noted on the U.S. EPA Chemical Speciation Network Assessment website (<https://www.sdas.battelle.org/CSNAssessment/html/Default.html>), funds saved by discontinuing the Naperville speciation monitor and reducing the sampling schedules would include investing in continuous measurements, new measurements and measurement technologies, equipment upgrade and replacement, and new sites in areas with emerging air quality issues.

Lastly, continued discussions between Illinois EPA and U.S. EPA regarding the primary objective of the Schiller Park PM_{2.5} sampler are ongoing. As of this writing, no change to the primary objective has taken place other than listing Schiller Park as source-oriented in Table 4 of this plan. A separate request will be submitted to U.S. EPA for approval to change Schiller Park’s PM_{2.5} primary objective to source-oriented.

Sulfur Dioxide

Illinois is required to operate six SO₂ monitors. One SO₂ monitor is required at each of the Northbrook and Bondville NCore sites to fulfill NCore requirements. The Illinois State Water Survey operates the Bondville SO₂ monitor. Additionally, six SO₂ monitoring sites are operated in Illinois' network supporting the basic monitoring objectives of public data reporting, air quality mapping, compliance, and supporting air pollution research studies. In 2016, a total of 12 SO₂ monitors were operated in Illinois. Site access was lost at the South Roxana monitoring location during the year. As a result, U.S. EPA approval for site discontinuation has been sought and is expected to be granted. Eleven SO₂ monitors were operated for the balance of the year.

New SO₂ data requirements established by U.S. EPA require either modeling or monitoring to characterize current air quality in areas with large sources of SO₂. ADM and Tate & Lyle, both in Decatur, have elected to pursue the monitoring route. As of this network plan's writing, the number and specific placement of the monitoring equipment is being finalized. In 2017, it is anticipated that two or three monitors will be operated within Decatur as a result of the new rule. Illinois EPA will provide USEPA with the details and review of the new Decatur monitors as soon as possible. With the addition of these new sites, a total of 13-14 sites will be operated in 2017.

Nitrogen Dioxide

Illinois is required to operate two NO₂ monitors. Illinois is also required to operate two near-road NO₂ monitors. In addition, federal regulations require the Regional Administrator to collaborate with each State in determining the need for additional NO₂ monitoring requirements beyond the minimum, with a primary focus on siting monitors in locations to protect susceptible and vulnerable populations. In Illinois, two NO₂ monitoring sites are designated, East St. Louis and ComEd. In 2016, the Illinois EPA monitoring network consisted of eight NO₂ monitoring sites with the addition of two near-road monitoring sites in the Chicago area. As referenced in the 2016 Annual Network Plan, federal rules were finalized during the course of the 2016 monitoring season allowing for the discontinuation of the NO₂ monitor in Northbrook. NO/NO_y continues to be measured at this site. Additionally, the Illinois State Water Survey operates an NO/NO_y monitor at the rural NCore site in Bondville. In 2017, Illinois EPA will operate seven NO₂ monitors. Two additional NO/NO_y monitors will continue to be operated by Illinois EPA and the State Water Survey.

Carbon Monoxide

Illinois must operate one CO monitor in conjunction with one near-road NO₂ monitor. In addition, it must operate one CO monitor at NCore sites. The Illinois State Water Survey operates the Bondville CO monitor at the rural NCore site. An additional CO monitoring site is operated in Illinois' network supporting the basic monitoring objectives of public data reporting, air quality mapping, compliance, and supporting air pollution research studies. In 2016, four CO monitors were in operation. In 2017, the number of CO sites will not change.

Particulate Matter (PM₁₀)

Illinois must operate three PM₁₀ monitors to satisfy MSA requirements. It must also operate one PM₁₀ monitor for NCore purposes. In 2016, the Illinois EPA operated a total of four PM₁₀ monitoring sites. In 2017, the Illinois EPA will continue to operate four PM₁₀ monitors.

Lead

Illinois is required to operate source-oriented monitors near facilities emitting 0.5 tons/year of lead that also have maximum lead concentrations in ambient air in excess of 50 percent of the NAAQS. Illinois operates four source-oriented monitors, one of which is a special purpose monitor located in Geneva. Lead monitoring is conducted at two additional sites, one in Granite City and another in southeast Chicago. Lead monitoring waivers are currently in place with U.S. EPA for three facilities: Kincaid Generation Power Plant in Kincaid, Aventine Renewable Energy Inc. in Pekin, and Dynergy Midwest Generation's Baldwin Power Plant in Baldwin. Modeling results for these facilities demonstrated that they do not have the potential to contribute to a maximum lead concentration greater than 50 percent of the NAAQS.

The Illinois EPA is proposing to discontinue the Riverdale (Mittal Steel) source-oriented lead monitor and the special purpose lead monitor in Geneva (Johnson Controls). Both of these monitors have three years of clean data (Table 2) and meet U.S. EPA guidance for shutdown as defined in 40 CFR 58 Subpart B 58.14(c)(1). Additionally, Appendix D to Part 58, 4.5(ii) – Lead Design Criteria states the Regional Administrator may waive the lead source requirement if the State can demonstrate the lead source will not contribute to a maximum lead concentration in ambient air in excess of 50 percent of the NAAQS based on historical monitoring data. Table 2 indicates yearly maximum three-month rolling averages as well as design value concentrations less than 50 percent of the NAAQS. In 2016, Illinois operated seven lead monitoring sites. As referenced in the 2016 Annual Network Plan, federal rules were finalized during the course of the 2016 monitoring season allowing for the discontinuation of the NCore lead monitor in Northbrook. Six lead monitors were operated for the balance of the year. In 2017, Illinois EPA will operate four lead monitors.

Table 2: Historical Lead Data

		Lead Maximum 3-month Rolling Averages			Design Values				
Site	AQS Code	2013	2014	2015	2013-2015	90% Upper Confidence Level	<10% of 80% of NAAQS	Exceedance?	Removable?
Riverdale	17-031-0113	0.01	0.03	0.01	0.03	0.031	Yes	No	Yes
Geneva	17-089-0113	0.03	0.03	0.05	0.05	0.051	Yes	No	Yes

AQS ID	Site Description	Latitude Longitude	Area Represented	Primary Objective	Secondary Objective	Spatial Scale	Station Type	Monitor Type	Sampling Schedule	Collocated
17-031-0022	Washington High School	+41.68716544 -87.53931548	Chicago-Naperville-Michigan City, IL-IN-WI	Highest Conc.	Source	Neighborhood	SLAMS	BETA	Hourly	
17-031-1016	Lyons Township	+41.801180 -87.832349	Chicago-Naperville-Michigan City, IL-IN-WI	Highest Conc.	Source	Middle	SLAMS	BETA	Hourly	
17-031-4201	Northbrook	+42.1399619 -87.7992262	Chicago-Naperville-Michigan City, IL-IN-WI	Population	N/A	Urban	NCORE	Hi-Vol	1/6	YES
17-119-1007	Granite City	+38.70453426 -90.13967484	St Louis, IL-MO	Highest Conc.	Source	Neighborhood	SLAMS	Hi-Vol	1/6	

Graseby Anderson Beta Attenuation (method 076); Met One Beta Attenuation (method 122); Sierra Anderson GMW Hi-Vol Volume Standard Conditions (method 063)

Red indicates monitor proposed for removal

Green indicates monitor proposed for installation

Gray indicates a proposed method or frequency change
