Re: Long-Term Monitoring Program  
1<sup>st</sup> Quarter 2017 Data Report  
Solutia Inc., W. G. Krummrich Plant, Sauget, IL

Dear Ms. Bury:

Enclosed please find the Long-Term Monitoring Program 1<sup>st</sup> Quarter 2017 Data Report for Solutia Inc.'s W. G. Krummrich Plant, Sauget, IL. Results from sampling of supplemental piezometers GWE-1D, 2D, and 3D and supplemental wells GWE-5D, ESL-MW-A and D1, and PM1D are also included in this report.

Per EPA's February 9, 2016, response to Solutia's December 23, 2015, submittal:

- sampling of supplemental piezometers GWE-5S and 5M and supplemental wells ESL-MW-C1 and PM1M has been discontinued; and
- the sampling frequency for supplemental piezometer GWE-1D and supplemental well ESL-MW-A has been reduced to the first and third quarters.

As noted in my e-mail dated January 31, 2017, Solutia will very shortly submit a "Periodic Technical Review" recommending changes to this groundwater monitoring program, along with similar Reviews for the other programs. One of those other Reviews will address Mississippi River surface water and sediment monitoring, the 1<sup>st</sup> quarter 2017 results of which are included in this submittal. Another such Review will address the related, "expanded" Chlorobenzene Process Area (CPA) monitoring program (begun in 4<sup>th</sup> quarter 2012 after a "baseline" event in 4<sup>th</sup> quarter 2011).

If you have any questions or comments regarding this report, please contact me at (314) 674-3312 or [gmrina@eastman.com](mailto:gmrina@eastman.com)

Sincerely,

## 1.0 INTRODUCTION

Golder Associates Inc. (Golder) is pleased to submit this report summarizing the 1st Quarter 2017 (1Q17) Long-Term Monitoring Program (LTMP) groundwater sampling activities at the Solutia Inc. (Solutia) W.G. Krummrich (WGK) plant (Site) in Sauget, Illinois. The plant is located at 500 Monsanto Avenue, Sauget, Illinois as shown on Figure 1.

The 1Q17 sampling event was performed in general accordance with the Revised LTMP Work Plan (Work Plan) (Solutia 2009). Work conducted during the LTMP is designed to evaluate the effectiveness of monitored natural attenuation (MNA). The effectiveness of MNA at the Site, is shown by the following:

- A clear and meaningful trend of decreasing contaminant mass
- Data that indirectly demonstrate the types and rates of natural attenuation process active at the Site
- Data that directly demonstrate the occurrence of biodegradation processes at the Site

The Work Plan addresses quarterly sampling requirements from the United States Environmental Protection Agency's (USEPA) February 26, 2008, Final Decision (USEPA, 2008). According to the Work Plan, ten (10) groundwater samples are to be collected from monitoring wells from two (2) source areas, former Benzene Storage Area and former Chlorobenzene Process Area; four (4) monitoring wells located downgradient of the former Benzene Storage Area; and four (4) monitoring wells located downgradient of the former Chlorobenzene Process Area. Monitoring wells are located in the Shallow Hydrogeologic Unit (SHU), Middle Hydrogeologic Unit (MHU) and Deep Hydrogeologic Unit (DHU). One (1) monitoring well is screened in the SHU at the former Benzene Storage Area. The remaining nine (9) wells are screened in the MHU and DHU. Analytical data from these wells are used to evaluate the attenuation processes in the America Bottoms aquifer, as impacted groundwater from these source areas migrates toward and discharges to the Mississippi River.

In addition to the monitoring wells specified in the Work Plan, the USEPA has also requested that groundwater samples be collected from additional monitoring wells and piezometers (supplemental wells) approximately 1.0 to 1.5 miles north of the Site. In response to Solutia's December 23, 2015, request, on February 9, 2016, the USEPA reduced the number of supplemental wells from eleven (11) to seven (7) for the first and third quarter sampling events and to five (5) for the second and fourth quarter sampling events.

The scope of work detailed in the Work Plan is summarized below.

Seventeen (17) monitoring wells and piezometers are sampled during the 1Q17 LTMP event. The locations of the monitoring wells, piezometers and source areas are shown on Figure 2 and the sample locations are included on the table below.

Area	Location Relative to Area	Sample Identification
Former Benzene Storage	Source Area Well	BSA-MW-1S
	Downgradient	BSA-MW-2D
		BSA-MW-3D
		BSA-MW-4D
		BSA-MW-5D
Former Chlorobenzene Process	Source Area Well	CPA-MW-1D
	Downgradient	CPA-MW-2D

		CPA-MW-5D
■ Supplemental Wells North of the Site	---	ESL-MW-A
		ESL-MW-D1
		GWE-1D
		GWE-2D
		GWE-3D
		GWE-5D
		PM1D

Water levels in the monitoring wells and piezometers are measured quarterly and total depths are measured in the 1<sup>st</sup> quarter of each year.

During the quarterly sampling events, monitoring wells and piezometers are sampled for the following volatile organic compound (VOC) analytes: benzene; chlorobenzene; 1,2-dichlorobenzene; 1,3-dichlorobenzene; and 1,4-dichlorobenzene. During the 1<sup>st</sup> and 3<sup>rd</sup> quarters, monitoring wells and piezometers are sampled for the following semi-volatile organic compound (SVOC) analytes: 4-chloroaniline (CPA-MW-3D, CPA-MW-4D and CPA-MW-5D); 2-chlorophenol (BSA and CPA wells); 1,2,4-trichlorobenzene (BSA and CPA wells); and 1,4-dioxane (BSA-MW-2D, BSA-MW-3D, BSA-MW-4D, and BSA-MW-5D). The following MNA parameters are sampled quarterly to evaluate active natural attenuation occurring at the Site:

- Electron Donors – total and dissolved organic carbon
- Electron Acceptors – iron, manganese, nitrate, sulfate
- Biodegradation Byproducts – carbon dioxide, chloride, methane
- Biodegradation Indicators – alkalinity

Microbial Insights BioTrap® samplers for Phospholipid Fatty Acid (PLFA) analysis and Stable Isotope Probes (SIPs) baited with benzene or chlorobenzene are deployed quarterly to demonstrate the occurrence of biodegradation occurring at the Site.

Mississippi River surface water and sediment samples are scheduled to be collected on a semi-annual basis (1<sup>st</sup> and 3<sup>rd</sup> quarter). To assess the impact of contaminated groundwater discharging into the river north of the Groundwater Migration Control System (GMCS), surface water and sediment samples were collected during the 1Q17 sampling event.

## 2.0 FIELD ACTIVITIES

Golder conducted 1Q17 sampling events between January 30 and February 2, 2017. Activities were performed in general accordance with the Work Plan.

### 2.1 Water Level Measurement

Prior to sampling during the 1Q17 event, Golder performed a synoptic round of water level measurements at 76 monitoring wells and piezometers on January 26 and January 27, 2017. DNAPL-K-7 was not accessible due to construction activities and was not included in water level measurements. The following monitoring well and piezometer series are included in the LTMP:

- BSA-series
- CPA-series
- ESL-series
- GM-series
- GWE-series
- K-series
- PS-MW-series
- PMA-series
- PM-series
- Piezometer clusters installed for Saugat Area 2 RI/FS and WGK CA-750 Environmental Indicator projects

An oil/water interface probe was used to measure the water level (to 0.01 feet) and, if present, detect and measure the thickness of non-aqueous phase liquid (NAPL). During the 1Q17 sampling event, NAPL was not detected in any of the monitoring wells or piezometers. Total depths are measured during the 1<sup>st</sup> quarter of each year. The 1Q17 well gauging information is shown on Table 1. The information collected from the MHU and the DHU was used to create a groundwater potentiometric surface map, as shown on Figure 3.

### 2.2 Groundwater Sample Collection

Monitoring wells and piezometers sampled during the 1Q17 LTMP event were purged and sampled using low-flow sampling techniques, low-density polyethylene tubing (LDPE) and a submersible or peristaltic pump (GWE-1D, GWE-2D and GWE-3D). The pump intake was placed at approximately the middle of the screened interval for each well. Purging was conducted at a rate of approximately 300 mL/min to reduce drawdown. Drawdown was measured throughout purging activities to ensure that it did not exceed 25% of

the distance between the pump intake and the top of the screen. Measurement of field parameters began once the flow rate and drawdown were stable. Parameters were measured for each system volume purged using a SmartTROLL™ multi-parameter meter. The system volume includes the volume of the tubing, the volume of the pump and the volume of flow-through cell containing the multi-parameter meter. Samples were collected after field parameters were stabilized within the ranges below for three (3) consecutive measurements:

- Dissolved Oxygen (DO): +/- 10% or +/- 0.2 mg/L, whichever is greatest
- Oxidation-Reduction Potential (ORP): +/- 20 mV
- pH: +/-0.2 standard units
- Specific Conductivity: +/- 3%

The flow rate was adjusted as needed to maintain approximately 300 mL/min during sampling activities. To reduce possible sample cross contamination, the flow-through cell was bypassed and gloves were replaced prior to sampling.

Sample bottles were provided by TestAmerica Laboratories, Inc. (TestAmerica) for the following analyses:

- VOCs – USEPA SW-846 Method 8260B
- SVOCs were analyzed using USEPA SW-846 Method 8270D Semi-Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry (GC/MS)
- MNA parameters – alkalinity and carbon dioxide (USEPA Method 310.1), chloride (USEPA Method 352.5), total and dissolved iron and total and dissolved manganese (USEPA SW-846 Method 6010C), methane, ethane and ethylene (RSK-175), nitrate (USEPA Method 353.2), sulfate (USEPA Method 375.4), and total and dissolved organic carbon (USEPA Method 415.1)

VOC and SVOC sample bottles were filled first followed by gas sensitive parameters and general chemistry parameters. Ferrous iron was field analyzed with a HACH 890 Colorimeter and HACH AccuVac® ampules. Samples collected for ferrous iron and dissolved analyses were field filtered using an in-line 0.2 micron disposable filter. Groundwater purging and sampling forms are included in Appendix A.

## 2.3 Quality Assurance and Sample Handling

Four (4) analytical duplicates (AD), three (3) equipment blanks (EB) and three (3) matrix spike/matrix spike duplicate (MS/MSD) pairs were collected during the 1Q17 LTMP sampling event. Laboratory provided trip blanks were included in each cooler containing samples for VOC analysis, for a total of five (5) trip blanks. Sample bottles were labeled with the date and time of sample collection, sampler initials, analysis requested, preservative used, and sample identification based on the following nomenclature “AAA-MW#-MMYY-QA/QC” or “BBBB-MMYY-QA/QC” where:

- “AAA” denotes “Benzene Storage Area (BSA)”, “Chlorobenzene Process Area (CPA)”, “East St. Louis (ESL)”, or “Groundwater Elevation (GWE)” and “MW#” denotes “Monitoring Well Number”
- “BBBB” denotes PM1M or PM1D for monitoring wells installed in January 2015

- “MMYY” denotes month and year of sampling quarter, e.g.: February (1<sup>st</sup> quarter), 2017 (0217)
- “QA/QC” denotes QA/QC sample
  - AD – Analytical Duplicate
  - EB – Equipment Blank
  - MS or MSD – Matrix Spike or Matrix Spike Duplicate

Samples that were field filtered with an in-line 0.2 micron filter include “F(0.2)” prior to the “MMYY” portion of the sample identification. Sample information was recorded on a chain-of-custody (COC) that included project identification, sample identification, date and time of sample collection, analysis requested, preservative used, sample matrix and type, number of sample containers, sampler signature, and date COC was completed. Copies of the COCs are included in Appendix B.

Directly after sampling, sample bottles were placed in an iced cooler to maintain a sample temperature of approximately 4°C. Prior to sample shipment, samples and ice were placed inside two (2) contractor trash bags. The bags were tied and the cooler was sealed between the lid and sides with a signed and dated custody seal. Samples were shipped overnight via FedEx to the TestAmerica facility in Savannah, Georgia.

## 2.4 Biodegradation Sampling

Bio-Trap® and SIP results are evaluated to provide biodegradation potential information in the SHU, the MHU and the DHU. Bio-Trap® samplers and SIPs are passive sampling tools that collect microbes across the samplers membrane that is, after time, analyzed. SIPs are baited with a specially synthesized form of the contaminant (i.e., benzene, chlorobenzene) in order to measure the degradation of a specific contaminant.

Bio-Trap® samplers and SIPs, provided by Microbial Insights, Inc. in Rockford, Tennessee, were deployed on December 30, 2016 in monitoring wells downgradient of the former Chlorobenzene Process Area (CPA-MW-1D through CPA-MW-5D) and downgradient of the former Benzene Storage Area (BSA-MW-1S and BSA-MW-2D through BSA-MW-5D) for PLFA analysis. A benzene SIP was deployed in monitoring well BSA-MW-2D and a chlorobenzene SIP was deployed in monitoring well CPA-MW-3D. Bio-Trap® samplers and SIPs were weighted and fastened to a stainless steel cable. The cable was secured to the well cap and the Bio-Trap® or SIP was lowered into the well and placed in the middle of the well screen.

On January 26, 2017, Bio-Trap® samplers and SIPs were collected from the wells, placed in laboratory provided bags, labeled with appropriate well identification, placed in a cooler with ice, properly sealed, and shipped overnight to the Microbial Insights, Inc. facility in Rockford, Tennessee for analysis.

## 2.5 Surface Water and Sediment Monitoring

Surface water/sediment sampling is typically performed concurrent to the groundwater sampling event to confirm groundwater is discharging to the river at the time of sampling. In addition, the sampling is performed to assess the relationship between VOC and SVOC concentrations in the river and in groundwater. The surface water and sediment sampling was conducted on February 6, 2017. Fluid levels in groundwater monitoring wells CPA-MW-5D, BSA-MW-5D, and BSA-MW-4D were measured on February 6, 2017. The water level elevations were measured at the following:

- CPA-MW-5D (391.70 ft above mean sea level (AMSL))
- BSA-MW-4D (392.70 ft AMSL)
- BSA-MW-5D (393.26 ft AMSL)

The levels were higher than the Mississippi River on February 6, 2017 (~389.98 ft AMSL); therefore discharge to the river was confirmed.

Surface water and sediment samples were collected from three (3) locations, R2007-1 through R2007-3. Sample locations R2007-1 through R2007-3 can be seen on Figure 2. Coordinates for the three sample locations were preloaded into a Trimble Global Positioning System (GPS) unit, and used for navigation to the sample locations. Field personnel positioned the sampling boat at a point where the dredge was able to reach the river bed. Surface water samples were collected prior to sediment samples to collect a sample representing the water column above the sediments and reduce potential contamination from the sediments or the sampling system.

During the 1Q17 River sampling event, samples were analyzed for the following VOCs: benzene, chlorobenzene, 1,2-dichlorobenzene, 1,3-dichlorobenzene, and 1,4-dichlorobenzene, and the following SVOCs: 1,4-dioxane, 4-chloroaniline, 2-chlorophenol, and 1,2,4-trichlorobenzene.

QA/QC and shipping procedures were similar to those described above for groundwater sample collection. The following field parameters were collected at the three (3) sample locations: temperature, pH, dissolved oxygen, and conductivity. Parameters were recorded using a YSI 556 MPS at a depth of one (1) foot below the water surface and recorded on field data forms.

Surface water samples were collected using LDPE tubing with weighted intake and a peristaltic pump. The pump intake was placed at the sediment-water interface (within one (1) foot of the river bottom). Tubing was fixed to the cable of the sediment sampler (ponar dredge) and lowered to the bottom of the river with the dredge. The flow rate was adjusted as needed to minimize volatilization. New tubing was used at each sample location. Sample bottles were provided by TestAmerica for VOC and SVOC analysis. VOC and SVOC sample bottles were filled directly from the tubing to reduce VOC and/or preservative loss. The unfiltered samples were submitted to the laboratory for analysis. Sampling forms are included in Appendix A.

Sediment samples were collected using a ponar grab sampler. The ponar grab sampler was deployed from a davit along the side of the boat, and raised and lowered with a winch. Prior to sampling, the grab sampler and other sampling devices (stainless steel bowl and spoon) were decontaminated with a distilled water and Alconox® wash, followed by a distilled water rinse. The ponar grab sampler was deployed multiple times to collect sufficient sample volume. Sediment samples were collected from the upper two (2) inches of the river bed. Upon recovery, the ponar grab sampler was opened and the sediment was moved to the stainless steel bowl. Samples for VOC analysis were obtained using a five (5) milliliter TerraCore® sampler, which was inserted into the sediment below the surface and carefully removed to prevent VOC loss.

COCs for surface water and sediment sampling are included in Appendix B.

## 2.6 Decontamination and Investigation Derived Waste

Sampling equipment was decontaminated prior to mobilizing to the Site, between sample locations and prior to demobilizing from the Site. Non-dedicated sampling equipment was decontaminated between samples with a non-phosphatic detergent solution and a deionized water rinse.

Investigation derived waste (IDW) was placed in 55-gallon drums, labeled with the generation date and staged for disposal by Solutia. IDW such as gloves and other disposable sampling equipment was bagged for disposal by Solutia.

## 3.0 QUALITY ASSURANCE

Golder completed validation of the analytical data following the general guidelines in Section 4.4 Data Review and Validation of the Work Plan. The Work Plan specifies that the most recent versions of the national data validation guidelines be used for data review. The following guidelines were generally used:

- USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review, EPA-540-R-08-01, June 2008
- USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review, EPA 540-R-10-011, January 2010

Although some data required qualifications due to quality control criteria that were not achieved, the data was deemed usable. The completeness for the data set was 100%. Qualifications are included in Appendix C.

- Downgradient of Former Chlorobenzene Process Area: 4-Chloroaniline was detected in CPA-MW-4D and CPA-MW-5D at concentrations of 120 µg/L and 19 µg/L respectively, downgradient of the former Chlorobenzene Process Area. 2-Chlorophenol was detected in CPA-MW-2D / CPA-MW-2D-AD and CPA-MW-5D at 31 / 37 µg/L and 23 µg/L respectively, downgradient of the former Chlorobenzene Process Area. 1,2,4-Trichlorobenzene was not detected downgradient of the former Chlorobenzene Process Area.

### 4.4 Surface Water and Sediment

Surface water and sediment samples were analyzed for the following VOCs: benzene, chlorobenzene, 1,2-dichlorobenzene, 1,3-dichlorobenzene, and 1,4-dichlorobenzene, along with the following SVOCs: 4-chloroaniline, 2-chlorophenol, 1,4-dioxane and 1,2,4-trichlorobenzene. Surface water and sediment analytical data are presented in Table 4 and 5, respectively. The surface water and sediment analytical laboratory results including data validation reports are included in Appendix E. There were no VOC or SVOC detections in the surface water samples and no SVOC detections in the surface water or sediment samples. Sediment samples were received at the laboratory with no preservatives in the sample vials and were therefore unusable.

### 4.5 Monitored Natural Attenuation

MNA parameter data for this quarter are presented in Table 3. Laboratory results for PLFA and SIP analysis are included in Appendix F. The SIP study (Appendix F) states the following:

- "The detection of <sup>13</sup>C-enriched biomass and DIC confirmed that benzene biodegradation had occurred at BSA-MW-2D-0217 during the deployment period".

- “Evidence for biodegradation of chlorobenzene in CPA-MW-3D-0217 was inconclusive, as the  $^{13}\text{C}$ -enriched biomass fell below the detection limit”.
- Dissolved inorganic carbon (DIC) data for BSA-MW-2D-0217 indicate that “benzene was mineralized under current site conditions.”
- Although DIC data for CPA-MW-3D-0217 indicate that “little to no chlorobenzene was mineralized during the deployment period,” the community structure contains contaminant-reducing bacteria.
- The PLFA analysis in the remaining BSA and CPA wells also show a community structure containing contaminant-reducing bacteria.

## 1.0 INTRODUCTION

Golder Associates Inc. (Golder) completed a review of analytical data for the groundwater, surface water, and sediment samples collected January 30 through February 6, 2017 at the Solutia Inc. (Solutia) W.G. Krummrich (WGK) plant (Site) in Sauget, Illinois. Golder collected a total of twenty three (23) samples from groundwater monitoring wells and piezometers and eleven (11) samples from three river sampling locations as part of the 1<sup>st</sup> Quarter 2017 (1Q17) Long-Term Monitoring Program (LTMP). Seventeen (17) groundwater samples, six (6) surface water and five (5) sediment samples, five (5) trip blanks, three (3) equipment blanks (EB), four (4) analytical duplicates (AD), and three (3) matrix spike/matrix spike duplicate (MS/MSD) pairs were prepared. Groundwater monitoring locations were located at the WGK facility or approximately 1.0 to 1.5 miles north of the Site. Surface water and sediment river sampling locations were located approximately 1 mile west-northwest of the Site. The samples were submitted to the TestAmerica Laboratories, Inc. (TestAmerica) facility located in Savannah, Georgia for analysis using United States Environmental Protection Agency (USEPA) methods, standard methods and USEPA SW-846 test methods. Samples submitted to TestAmerica were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), total and dissolved metals, dissolved gases, and general chemistry parameters. The analytical results were placed into five (5) sample delivery groups (SDGs) and described in the table below:

The samples were collected and analyzed in general accordance with the Revised Long-Term Monitoring Program (LTMP) Work Plan (Work Plan) (Solutia 2009). Groundwater samples were analyzed for VOCs, SVOCs, total and dissolved metals, dissolved gases, and general chemistry parameters. The general chemistry parameters included chloride, nitrate, sulfate, total organic carbon (TOC), alkalinity, carbon dioxide, and dissolved organic carbon (DOC). Five (5) trip blanks, three (3) EBs, four (4) ADs, and three (3) MS/MSD pairs were submitted and analyzed for VOC and SVOC analysis. The following analytical methods used are from USEPA document SW-846, Test Methods for Evaluating Solid Waste, Revision 6 contained in Final Update III August 2002 and listed below:

- VOCs were analyzed using USEPA SW-846 Method 8260B Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry (GC/MS)
- SVOCs were analyzed using USEPA SW-846 Method 8270D Semi-Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry (GC/MS)
- Total and Dissolved Iron and Manganese were analyzed by USEPA SW-846 Method 6010C Inductively Coupled Plasma-Atomic Emission Spectrometry

The following standard methods were used to analyze monitored natural attenuation (MNA) parameters:

- Dissolved Gases analyzed by Method RSK-175
- Alkalinity and Free Carbon Dioxide analyzed by USEPA Method 310.1 by Titration
- Chloride analyzed by USEPA Method 325.2 by Automated Colorimetry

- Nitrogen, Nitrate analyzed by USEPA Method 353.2 by Automated Colorimetry
- Sulfate analyzed by USEPA Method 375.4 by Spectrophotometer
- Total and Dissolved Organic Carbon analyzed by USEPA Method 415.1

Golder completed validation of the analytical data following the general guidelines in Section 4.4 Data Review and Validation of the Work Plan. The Work Plan specifies that the most recent versions of the national data validation guidelines be used for data review. The following guidelines were generally used:

- USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review, EPA-540-R-08-01, June 2008
- USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review, EPA 540-R-10-011, January 2010

These documents are hereafter referred to as the "functional guidelines". If there was a conflict between the functional guidelines and the quality control criteria specified in the analytical method, the method-specific criteria were used. The SDGs were prepared as a Level IV data report package containing quality control information and raw data. Golder completed Level III review of 100% of the analytical data and Level IV review of 10% of the analytical data.

Data that has been qualified by the data validator has been added to the laboratory report. The qualifiers indicate data that did not meet acceptance criteria and corrective actions were not successful or not performed. Laboratory data qualifiers are defined below:

- U – The analyte was analyzed for but not detected

Golder data qualifiers are defined below:

- D – The analyte was analyzed at a dilution

Sections 2 and 3 summarize the specific instances where quality control criteria in the functional guidelines were not met. As specified in the functional guidelines, if the non-adherence to quality control criteria is slight, professional judgment was used in qualification of the data. However, if the non-adherence is significant, qualification and rejection of the data may be necessary. A summary of qualified data is provided in Section 5.0.

## 2.0 VOLATILE ORGANIC COMPOUNDS

Samples were collected from seventeen (17) groundwater monitoring locations and three (3) river sampling locations and analyzed for VOCs. Analytical duplicate samples were collected from four (4) sampling locations, CPA-MW-2D, CPA-MW-3D, SW-R2007-1, and SED-R2007-1. Three (3) EBs and five (5) trip blanks were also prepared and shipped for laboratory analysis. The samples were submitted to TestAmerica, placed into five (5) data packages or SDGs (KPS185, KPS186, KPS187, KPS188, and KRS018) and were prepared and analyzed using SW-846 Method 8260B. Samples were validated in general accordance with the functional guidelines. Results of the validation are summarized below.

## 2.1 Receipt Condition and Sample Holding Times

The SDG Case Narrative, chain-of-custody, login sample receipt checklist, and analysis dates were reviewed to verify analytical method holding times and proper preservation upon sampling. A summary of affected SDGs is provided below.

KPS185, KPS186, KPS187, and KPS188 – Samples were received at temperatures below the  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$  criteria. The samples in these SDGs were otherwise received in good condition and data qualification was not required.

KRS018 - Sediment samples were received at the laboratory with no preservatives in the sample vials and were therefore unusable.

## 2.2 Blanks

Laboratory and field blanks, including trip blanks, method blanks and equipment blanks are prepared and analyzed to determine if contamination occurred as a result of laboratory or field activities.

Five (5) laboratory prepared trip blanks were shipped and analyzed for VOCs during the 1Q17 event to evaluate whether cross contamination occurred during sample shipment. Results for contaminants of concern for the received trip blanks were non-detect.

Laboratory method blanks were performed for each laboratory system as outlined for each analytical method to evaluate whether cross contamination occurred during laboratory analysis activities. Results for the method blanks were non-detect.

Three (3) EBs were collected during the 1Q17 event to assess the effectiveness of the decontamination procedure. Detections were noted in the following EBs:

- BSA-MW-3D-0217-EB (SDG KPS187): chlorobenzene at 1.1 µg/L
- BSA-MW-1S-0217-EB (SDG KPS188): benzene at 140 µg/L, chlorobenzene at 3.6 µg/L, 1,2-dichlorobenzene at 2.9 µg/L, and 1,4-dichlorobenzene at 2.8 µg/L

The samples associated with the EBs were not qualified based on the 5Xs concentration criteria.

## 2.3 Surrogate Spike Recoveries

Samples to be analyzed for VOCs were spiked with surrogate compounds: 4-bromofluorobenzene, 1,2-dichloroethane-d4, dibromofluoromethane, and toluene-d8, prior to analysis, to evaluate overall laboratory performance. Surrogate recoveries were within control limits.

## 2.4 Laboratory Control Sample Recoveries

A laboratory control sample (LCS) is analyzed on each laboratory system to evaluate the analytical method accuracy and laboratory performance. LCS recoveries were within acceptance criteria.

## 2.5 Matrix Spike/Matrix Spike Duplicate (MS/MSD) Samples

MS/MSD samples are analyzed to determine long term precision and accuracy of the analytical method on various matrices. One (1) MS/MSD pair is sampled for every twenty (20) field samples. Three (3) MS/MSD pairs were collected during the 1Q17 event associated with samples BSA-MW-5D, SW-R2007-3, and SED-R2007-3. MS/MSD accuracy and precision data met criteria; therefore qualification was not required.

## 2.6 Analytical Duplicates

One (1) AD is collected for every ten (10) field samples to determine the overall precision of field and laboratory methods. Four (4) ADs were collected during the 1Q17 event associated with samples CPA-MW-2D, CPA-MW-3D, SW-R2007-1, and SED-R2007-1. The relative percent difference (RPD) between the samples and the associated ADs did not exceed 25%; therefore, data qualification was not required.

## 2.7 Internal Standard Responses

Internal standard performance criteria ensure that GC/MS sensitivity and response are stable during each analysis. Internal standard area counts did not vary by more than a factor of two (2) from the associated 12 hour calibration standard. Internal standard retention times did not vary more than +/-30 seconds from the retention time of the associated 12 hour calibration standard. Data qualification was not required.

## 2.8 Results Reported From Dilutions

Several VOC samples required dilutions due to high levels of target analytes. Reporting limits were adjusted to reflect the dilution. Result qualifications are shown in Section 5.0.

## 3.0 SEMI-VOLATILE ORGANIC COMPOUNDS

Samples were collected from seventeen (17) groundwater monitoring locations and three (3) river sampling locations and analyzed for SVOCs. Analytical duplicate samples were collected from four (4) sampling locations, CPA-MW-2D, CPA-MW-3D, SW-R2007-1, and SED-R2007-1. Three (3) EBs were also prepared and shipped for laboratory analysis. The samples were submitted to TestAmerica, placed into five (5) data packages or SDGs (KPS185, KPS186, KPS187, KPS188, and KRS018) and were prepared and analyzed using SW-846 Method 8270D. Samples were validated in general accordance with the functional guidelines. Results of the validation are summarized below.

### 3.1 Receipt Condition and Sample Holding Times

The SDG Case Narrative, chain-of-custody, login sample receipt checklist, and analysis dates were reviewed to verify analytical method holding times and proper preservation upon sampling. A summary of affected SDGs is provided below.

KPS185, KPS186, KPS187, and KPS188 – Samples were received at temperatures below the  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$  criteria. The samples in these SDGs, and in KRS018, were otherwise received in good condition and data qualification was not required.

### 3.2 Blanks

Laboratory and field blanks, including method blanks and equipment blanks are prepared and analyzed to determine if contamination occurred as a result of laboratory or field activities.

Laboratory method blanks were performed for each laboratory system as outlined for each analytical method to evaluate whether cross contamination occurred during laboratory analysis activities. Results for the method blanks were non-detect.

Three (3) EBs were collected during the 1Q17 event, associated with sample BSA-MW-1S, BSA-MW-3D and SED-R2007-1 to assess the effectiveness of the decontamination procedure. Results for the EBs were non-detect.

### 3.3 Surrogate Spike Recoveries

Samples to be analyzed for SVOCs were spiked with surrogate compounds: 2-fluorobiphenyl, 2-fluorophenol, nitrobenzene-d5, phenol-d5, terphenyl-d14, and 2,4,6-tribromophenol, prior to analysis, to evaluate overall laboratory performance. Surrogate recoveries were within control limits.

### 3.4 Laboratory Control Sample Recoveries

A LCS is analyzed on each laboratory system to evaluate the analytical method accuracy and laboratory performance. LCS recoveries were within acceptance criteria.

### 3.5 Matrix Spike/Matrix Spike Duplicate (MS/MSD) Samples

MS/MSD samples are analyzed to determine long term precision and accuracy of the analytical method on various matrices. One (1) MS/MSD pair is sampled for every twenty (20) field samples. Three (3) MS/MSD pairs were collected during the 1Q17 event associated with samples BSA-MW-5D, SW-R2007-3, and SED-R2007-3. Some MS/MSD data for these samples was outside acceptance criteria. Since MS/MSD data alone cannot be used to evaluate the precision and accuracy of data, qualification was not required.

### 3.6 Analytical Duplicates

One (1) AD is collected for every ten (10) field samples to determine the overall precision of field and laboratory methods. Four (4) ADs were collected during the 1Q17 event associated with samples CPA-MW-2D, CPA-MW-3D, SW-R2007-1, and SED-R2007-1. The relative percent difference (RPD) between the samples and the associated ADs did not exceed 25%; therefore, data qualification was not required.

### 3.7 Internal Standard Responses

Internal standard performance criteria ensure that GC/MS sensitivity and response are stable during each analysis. Internal standard area counts did not vary by more than a factor of two (2) from the associated 12 hour calibration standard. Internal standard retention times did not vary more than  $\pm 30$  seconds from the retention time of the associated 12 hour calibration standard. Data qualification was not required.

### 3.8 Results Reported From Dilutions

Sample CPA-MW-1D-0217 required dilution due to high levels of 1,2,4-trichlorobenzene. Reporting limits were adjusted to reflect the dilution. Result qualifications are shown in Section 5.0.

## 4.0 INORGANICS AND GENERAL CHEMISTRY

Samples were collected from seventeen (17) groundwater monitoring locations and analyzed for inorganics and general chemistry. The samples were submitted to TestAmerica, placed into five (5) data packages or SDGs (KPS185, KPS186, KPS187, KPS188, and KRS018), and were prepared and analyzed using the following methods:

- Total and Dissolved Iron and Manganese analyzed by Method 6010C Inductively Coupled Plasma-Atomic Emission Spectrometry
- Dissolved Gases analyzed by Method RSK-175
- Alkalinity and Free Carbon Dioxide analyzed by USEPA Method 310.1 by Titration
- Chloride analyzed by USEPA Method 325.2 by Automated Colorimetry
- Nitrogen, Nitrate analyzed by USEPA Method 353.2 by Automated Colorimetry
- Sulfate analyzed by USEPA Method 375.4 by Spectrophotometer
- Total and Dissolved Organic Carbon analyzed by USEPA Method 415.1

Samples were validated in general accordance with the functional guidelines. Results of the validation are summarized below.

### 4.1 Receipt Condition and Sample Holding Times

The SDG Case Narrative, chain-of-custody, login sample receipt checklist, and analysis dates were reviewed to verify analytical method holding times and proper preservation upon sampling. A summary of affected SDGs is provided below.

KPS185, KPS186, KPS187, and KPS188 – Samples were received at temperatures below the  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$  criteria. The samples were otherwise received in good condition and data qualification was not required.

## 4.2 Blanks

Laboratory method blanks are prepared and analyzed to determine if contamination occurred as a result of laboratory activities.

Laboratory method blanks were performed for each laboratory system as outlined for each analytical method to evaluate whether cross contamination occurred during laboratory analysis activities. Results for the method blanks were non-detect.

## 4.3 Laboratory Control Sample Recoveries

A LCS is analyzed on each laboratory system to evaluate the analytical method accuracy and laboratory performance. LCS recoveries were within acceptance criteria; therefore, data qualification was not required.

## 4.4 Matrix Spike/Matrix Spike Duplicate (MS/MSD) Samples

MS/MSD samples are analyzed to determine long term precision and accuracy of the analytical method on various matrices. Although MS/MSD analysis was not required for inorganic and general chemistry per the Work Plan, the laboratory spiked groundwater samples BSA-MW-2D, GWE-5D, and ESL-MW-D1 for various analytes. Some MS/MSD data for these samples was outside acceptance criteria. Since MS/MSD data alone cannot be used to evaluate the precision and accuracy of data, data qualification was not required for associated samples.

## 4.5 Results Reported From Dilutions

Samples in each SDG required dilutions due to high levels of target analytes. Reporting limits were adjusted to reflect the dilution. Result qualifications are shown in Section 5.0.

## 5.0 SUMMARY

Golder validated the data collected during the 1Q17 sampling event from the Solutia Inc. WGK plant in general accordance with the Work Plan and USEPA functional guidelines. Although some data required qualifications due to quality control criteria that were not achieved, the data were deemed usable. Where a positive result was qualified as estimated, the analyte should be considered present. Similarly, a result that was qualified as an estimated reporting limit should be considered not present for the purposes of this program, although the limit itself may not be precise. The completeness for the entire data set was 100%.

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In the event of interference or analytes present at high concentrations, samples may be diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

#### **RECEIPT**

## Narrative

### CASE NARRATIVE

**Client: Solutia Inc.**

**Project: 1Q17 LTM GW Sampling-1403345**

**Report Number: 680-134841-1**

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In the event of interference or analytes present at high concentrations, samples may be diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

This report was revised on 4/7/17 to correct the carbon dioxide method blank detection that was an error.

## **RECEIPT**

The samples were received on 02/01/2017; the samples arrived in good condition, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 0.3° C and 0.9° C.

## **VOLATILE ORGANIC COMPOUNDS (GC-MS)**

Samples GWE-5D-0217 (680-134841-1), BSA-MW-5D-0217 (680-134841-3), CPA-MW-4D-0217 (680-134841-5), BSA-MW-4D-0217 (680-134841-7) and 1Q17 LTM Trip Blank #2 (680-134841-9) were analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 02/09/2017 and 02/10/2017.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-468513.

Sample BSA-MW-4D-0217 (680-134841-7)[20X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## **SEMOVOLATILE ORGANIC COMPOUNDS (AQUEOUS)**

Samples BSA-MW-5D-0217 (680-134841-3), CPA-MW-4D-0217 (680-134841-5) and BSA-MW-4D-0217 (680-134841-7) were analyzed for Semivolatile Organic Compounds (Aqueous) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 02/02/2017 and analyzed on 02/03/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## **DISSOLVED GASES**

Samples GWE-5D-0217 (680-134841-1), BSA-MW-5D-0217 (680-134841-3), CPA-MW-4D-0217 (680-134841-5) and BSA-MW-4D-0217 (680-134841-7) were analyzed for dissolved gases in accordance with RSK-175. The samples were analyzed on 02/09/2017, 02/14/2017 and 02/17/2017.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-468340. Laboratory Control Samples and Laboratory Control Samples Duplicate were preformed to demonstrate precision.

The closing continuing calibration verification (CCV) standards associated with batch 680-468923 failed to meet acceptance limits. The samples BSA-MW-5D-0217 (680-134841-3), CPA-MW-4D-0217 (680-134841-5) and BSA-MW-4D-0217 (680-134841-7) were re-analyzed following a successful CCV and produced similar results but were outside of their analytical holding time. Both sets of data have been qualified and reported.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## Narrative

### CASE NARRATIVE

**Client: Solutia Inc.**

**Project: 1Q17 LTM GW Sampling-1403345**

**Report Number: 680-134903-1**

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In the event of interference or analytes present at high concentrations, samples may be diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

This report was revised on 4/7/17 to correct the carbon dioxide method blank detection that was an error.

## RECEIPT

The samples were received on 02/02/2017; the samples arrived in good condition, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.2° C and 2.4° C.

## VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples GWE-3D-0217 (680-134903-1), GWE-2D-0217 (680-134903-3), GWE-1D-0217 (680-134903-5), BSA-MW-3D-0217 (680-134903-7), BSA-MW-3D-0217-EB (680-134903-9) and 1Q17LTM Trip Blank #3 (680-134903-10) were analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 02/09/2017 and 02/10/2017.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-468513.

Samples GWE-3D-0217 (680-134903-1)[10X], GWE-2D-0217 (680-134903-3)[5X] and BSA-MW-3D-0217 (680-134903-7)[20X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## SEMICVOLATILE ORGANIC COMPOUNDS (AQUEOUS)

Samples BSA-MW-3D-0217 (680-134903-7) and BSA-MW-3D-0217-EB (680-134903-9) were analyzed for Semivolatile Organic Compounds (Aqueous) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 02/06/2017 and analyzed on 02/08/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## DISSOLVED GASES

Samples GWE-3D-0217 (680-134903-1), GWE-2D-0217 (680-134903-3), GWE-1D-0217 (680-134903-5) and BSA-MW-3D-0217 (680-134903-7) were analyzed for dissolved gases in accordance with RSK-175. The samples were analyzed on 02/14/2017 and 02/17/2017.

The closing continuing calibration verification (CCV) standards associated with batch 680-468923 failed to meet acceptance limits. The associated samples were re-analyzed following a successful CCV and produced similar results but were outside of their analytical holding time. Both sets of data have been qualified and reported.

The closing continuing calibration verification (CCV) standards associated with batch 680-468923 failed to meet acceptance limits. There was insufficient sample volume for re-analysis; samples have been qualified and reported.  
GWE-2D-0217 (680-134903-3)

### Narrative

#### CASE NARRATIVE

**Client: Solutia Inc.**

**Project: 1Q17 LTM GW Sampling - 1403345**

**Report Number: 680-134948-1**

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In the event of interference or analytes present at high concentrations, samples may be diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

This report was revised on 4/7/17 to correct the carbon dioxide method blank detection that was an error.

### RECEIPT

The samples were received on 02/03/2017; the samples arrived in good condition, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 1.9° C, 3.7° C and 4.0° C.

### Narrative

### CASE NARRATIVE Client: Solutia Inc. Project: WGK River Sampling

Report Number: 680-135038-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In the event of interference or analytes present at high concentrations, samples may be diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

This report was revised on 4/5/2017 to add SDG KRS018 to the report.

### RECEIPT

The samples were received on 02/07/2017; the samples arrived in good condition, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 4.6° C and 4.8° C.

### Receipt Exception

The following terra core vials were received with no preservative in the vials: SED-R2007-1-0217 (680-135038-6), SED-R2007-2-0217 (680-135038-7), SED-R2007-3-0217 (680-135038-8), SED-R2007-3-0217-MS (680-135038-8[MS]), SED-R2007-3-0217-MSD (680-135038-8[MSD]) and SED-R2007-1-0217-AD (680-135038-9) and were therefore not usable.

### VOLATILE ORGANIC COMPOUNDS (GC-MS)

# Phospholipid Fatty Acid Analysis

## Interpretation Guidelines

Phospholipids fatty acids (PLFA) are a main component of the membrane (essentially the “skin”) of microbes and provide a powerful tool for assessing microbial responses to changes in their environment. This type of analysis provides direct information for assessing and monitoring sites where bioremediation processes, including natural attenuation, are of interest. Analysis of the types and amount of PLFA provides a broad based understanding of the entire microbial community with information obtained in three key areas viable biomass, community structure and metabolic activity.

### **What is the detection limit for PLFA?**

Our limit of detection for PLFA analysis is ~150 picomoles of total PLFA and our limit of quantification is ~500 picomoles of total PLFA. Samples which contain PLFA amounts at or below 150 pmol cannot be used to determine biomass, likewise samples with PLFA content below ~500 pmol are generally considered to contain too few fatty acids to discuss community composition.

### **How should I interpret the PLFA results?**

Interpreting the results obtained from PLFA analysis can be somewhat difficult, so this document was designed to provide a technical guideline. For convenience, this guideline has been divided into the three key areas.

### **Viable Biomass**

PLFA analysis is one of the most reliable and accurate methods available for the determination of viable microbial biomass. Phospholipids break down rapidly upon cell death (21, 23), so biomass calculations based on PLFA content do not contain ‘fossil’ lipids of dead cells.

#### **How is biomass measured?**

Viable biomass is determined from the total amount of PLFA detected in a given sample. Since, phospholipids are an essential part of intact cell membranes they provide an accurate measure of viable cells.

#### **How is biomass calculated?**

Biomass levels are reported as cells per gram, mL or bead, and are calculated using a conversion factor of 20,000 cells/pmol of PLFA. This conversation factor is based upon cells grown in laboratory media, and varies somewhat with the type of organism and environmental conditions.

#### **What does the concentration of biomass mean?**

The overall abundance of microbes within a given sample is often used as an indicator of the potential for bioremediation to occur, but understanding the levels of biomass within each sample can be cumbersome. The following are benchmarks that can be used to understand whether the biomass levels are low, moderate or high.

Low	Moderate	High
$10^3$ to $10^4$ cells	$10^5$ to $10^6$ cells	$10^7$ to $10^8$ cells

### **How do I know if a change in biomass is significant?**

One of the primary functions of using PLFA analysis at contaminated sites is to evaluate how a community responds following a given treatment, but how does one know if the changes observed between two events are significant? As a general rule, biomass levels which increase or decrease by at least an order of magnitude are considered to be significant. However, changes in biomass levels of less than an order of magnitude may still show a trend. It is important to remember that many factors can affect microbial growth, so factors other than the treatment could be influencing the changes observed between sampling events. Some of the factors to consider are: temperature, moisture, pH, etc. The following illustration depicts three types of changes that occurred over time and the conclusions that could be drawn.

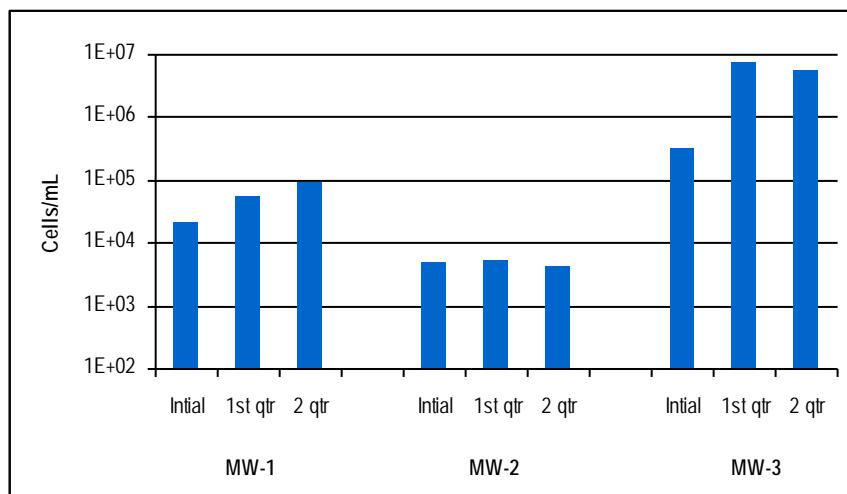

Figure 1. Biomass content is presented as a cell equivalent based on the total amount of phospholipid fatty acids (PLFA) extracted from a given sample. Total biomass is calculated based upon PLFA attributed to bacterial and eukaryotic biomass (associated with higher organisms).

### **Conclusions from graph above:**

- MW-1 showed a trend of biomass levels increasing steadily over time, although cell concentrations were  $\sim 10^4$  cells/mL at each sampling event.
- MW-2 showed no notable trends or significant changes in biomass concentrations.
- MW-3 showed a significant increase in biomass levels between the initial and 1<sup>st</sup> quarter sampling events (from  $\sim 10^5$  to  $\sim 10^6$  cells/mL).

## Community Structure:

The PLFA in a sample can be separated into particular types, and the resulting PLFA “profile” reflects the proportions of the categories of organisms present in the sample. Because groups of bacteria differ in their metabolic capabilities, determining which bacterial groups are present and their relative distributions within the community can provide information on what metabolic processes are occurring at that location. This in turn can also provide information on the subsurface conditions (i.e. oxidation/reduction status, etc.). Table 1 describes the six major structural groups used and their potential relevance to site specific projects.

Table 1. Description of PLFA structural groups.

PLFA Structural Group	General classification	Potential Relevance to Bioremediation Studies
Monoenoic (Monos)	Abundant in Proteobacteria (Gram negative bacteria), typically fast growing, utilize many carbon sources, and adapt quickly to a variety of environments.	Proteobacteria is one of the largest groups of bacteria and represents a wide variety of both aerobes and anaerobes. The majority of Hydrocarbon utilizing bacteria fall within the Proteobacteria
Terminally Branched Saturated (TerBrSats)	Characteristic of Firmicutes (Low G+C Gram-positive bacteria), and also found in Bacteroides, and some Gram-negative bacteria (especially anaerobes).	Firmicutes are indicative of presence of anaerobic fermenting bacteria (mainly <i>Clostridia/Bacteroides</i> -like), which produce the H <sub>2</sub> necessary for reductive dechlorination
Branched Monoenoic (BrMonos)	Found in the cell membranes of micro-aerophiles and anaerobes, such as sulfate- or iron-reducing bacteria	In contaminated environments high proportions are often associated with anaerobic sulfate and iron reducing bacteria
Mid-Chain Branched Saturated (MidBrSats)	Common in sulfate reducing bacteria and also Actinobacteria (High G+C Gram-positive bacteria).	In contaminated environments high proportions are often associated with anaerobic sulfate and iron reducing bacteria
Normal Saturated (Nsats)	Found in all organisms.	High proportions often indicate less diverse populations.
Polyenoic	Found in eukaryotes such as fungi, protozoa, algae, higher plants, and animals.	Eukaryotic scavengers will often rise up and prey on contaminant utilizing bacteria

Following are answers to some of the common questions about community composition and some detailed descriptions of some typical shifts which can be observed between sampling events.

### **How is the community structure data presented?**

Community structure data is presented as percentage (%) of the total amount of PLFA. In order to relate the complex mixture of PLFA to the organisms present, the ratio of a specific PLFA group is determined (detailed in Table 1 above), and this corresponds to the proportion of the related bacterial classification within the overall community structure. Because normal saturated PLFA are found in both prokaryotes (bacteria) and eukaryotes (fungi, protozoa, diatoms etc), their distribution provides little insight into the types of microbes that are present at a sampling location. However, high proportions of normal saturates are often associated with less diverse microbial populations.

### **How can community structure data be used to manage my site?**

It is important to understand that microbial communities are often a mixture of different types of bacteria (e.g. aerobes, sulfate reducers, methanogens, etc) with the abundance of each group behaving like a seesaw, i.e. as the population of one group increases, another is likely decreasing, mostly due to competition for available resources. The PLFA profile of a sample provides a “fingerprint” of the microbial community, showing relative proportions of the specific bacterial types at the time of sampling. This is a great tool for detecting shifts within the community over time and also to evaluate similarities/differences between sampling locations. It is important to note that PLFA analysis of community structure is analyzing the microbes directly, not just secondary breakdown products. So this provides evidence of how the entire microbial community is responding to the treatment.

## How do I recognize community shifts and what they mean?

Shifts in the community structure are indications of changing conditions and their effect on the microbial community, and, by extension on the metabolic processes occurring at the sampling location. Some of the more commonly seen shifts within the community are illustrated and discussed below:

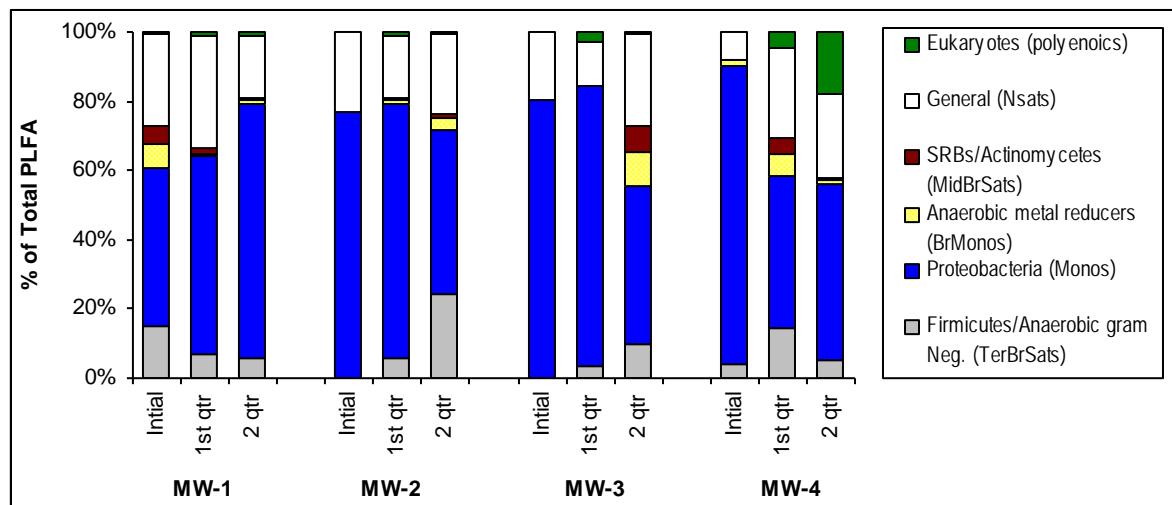

Figure 2. Relative percentages of total PLFA structural groups in the samples analyzed. Structural groups are assigned according to PLFA chemical structure, which is related to fatty acid biosynthesis. See Table 1 for detailed descriptions of structural groups.

- **Increased Proteobacteria**

Proportions of Proteobacteria are of interest because it is one of the largest groups of bacteria and represents a wide variety of both aerobe and anaerobes. The majority of hydrocarbons (including benzene and naphthalene) are metabolized by some member of Proteobacteria, mainly due to their ability to grow opportunistically, quickly taking advantage of available food (i.e. hydrocarbons), and adapting quickly to changes in the environment. The detection of increased proportions of Proteobacteria coupled with increased biomass suggests that the Proteobacteria are consuming something. In situations where it is important to determine the extent to which the Proteobacteria are utilizing anaerobic or aerobic pathways, it is possible to measure relative proportions of specific biomarkers that are associated with anaerobic or aerobic pathways thus separating the Proteobacteria into different groups, based on pathways used. Sample MW-1 from Figure 2 depicts a shift in community structure where the proportion of Proteobacteria has increased over time.

- **Increased Firmicutes/Aerobic Gram negative bacteria**

Increased proportions of Firmicutes/Aerobic Gram negative bacteria generally indicate that conditions are becoming more reductive (i.e. more anaerobic). Proportions of Firmicutes are of particular interest in sites contaminated with chlorinated hydrocarbons because Firmicutes include anaerobic fermenting bacteria (mainly *Clostridia/Bacteroides*-like), which produce the H<sub>2</sub> necessary for reductive dechlorination.

Enhanced bioremediation of chlorinated solvents often employs the injection of fermentable substrates which, when utilized by fermenting bacteria, results in the release of H<sub>2</sub>. Engineered shifts in the microbial community can be shown by observing increased proportions Firmicutes following an injection of fermentable substrate. Through long-term monitoring of the community structure it is possible to know when re-injection may be necessary or desirable. Sample MW-2 from Figure 2 depicts a shift in community structure where the proportion of Firmicutes has increased over time.

- **Increased anaerobic metal reducing bacteria (BrMonos) and SRB/Actinomycetes (MidBrSats)**

An increase in the proportions of metal and sulfate reducing bacterial groups, especially when combined with shifts in the other bacterial groups, can provide information helpful to monitoring bioremediation. Generally, an increase in metal and sulfate reducers points to more reduced (anaerobic) conditions at the sampled location. This is especially true if there is an increase in Firmicutes at the same time. Large increases in either metal and sulfate reducers, particularly if accompanied by a decrease in Firmicutes, may suggest that conditions are becoming increasingly reduced. In this situation the metal and sulfate reducers may be out-competing dechlorinators for available H<sub>2</sub>, thereby limiting the potential for reductive dechlorination at that location. Sample MW-3 from Figure 2 depicts a shift in community structure where the proportion of metal reducing bacteria has increased over time.

- **Increased Eukaryotes**

Eukaryotes include organisms such as fungi, protozoa, and diatoms. At a contaminated location, an increase in eukaryotes, particularly if seen with a decrease in the contaminant utilizing bacteria, suggests that eukaryotic scavengers are preying upon what had been an abundance of bacteria which were consuming the contaminant. Sample MW-4 from Figure 2 depicts a shift in community structure where the proportion of eukaryotes has increased over time.

### **Physiological status of Proteobacteria**

The membrane of a microbe adapts to the changing conditions of its environment, and these changes are reflected in the PLFA. Toxic compounds or environmental conditions may disrupt the membrane and some bacteria respond by making *trans* fatty acids instead of the usual *cis* fatty acids (7) in order to strengthen the cell membrane, making it less permeable. Many Proteobacteria respond to lack of available substrate or to highly toxic conditions by making cyclopropyl (7) or mid-chain branched fatty acids (20) which point to less energy expenditure and a slowed growth rate. The physiological status ratios for Decreased Permeability (*trans/cis* ratio) and for Slowed Growth (*cy/cis* ratio) are based on dividing the amount of the fatty acid induced by environmental conditions by the amount of its biosynthetic precursor.

#### ***What does slowed growth or decreased permeability mean?***

Ratios for slowed growth and for decreased permeability of the cell membrane provide information on the “health” of the Gram negative community, that is, how this population is responding to the conditions present in the environment. It should be noted that one must be cautious when interpreting these measures from only one sampling event. The most effective way to use the physiological status indicators is in long term monitoring and comparing how these ratios increase/decrease over time.

A marked increase in either of these ratios suggests a change in environment which is less favorable to the Gram negative Proteobacteria population. The ratio for slowed growth is a relative measure, and does not directly correspond to log or stationary phases of growth, but is useful as a comparison of growth rates among sampling locations and also over time. An increase in this ratio (i.e. slower growth rate) suggests a change in conditions which is not as supportive of rapid, “healthy” growth of the Gram negative population, often due to reduced available substrate (food). A larger ratio for decreased permeability suggests that the environment has become more toxic to the Gram negative population, requiring energy expenditure to produce *trans* fatty acids in order to make the membrane more rigid.

## Executive Summary

A Stable Isotope Probing (SIP) study was performed to determine whether biodegradation of benzene and chlorobenzene is occurring under existing site conditions. Bio-Trap® samplers baited with  $^{13}\text{C}$  labeled benzene and  $^{13}\text{C}$  labeled chlorobenzene were deployed in monitoring wells BSA-MW-2D-0217 and CPA-MW-3D-0217, respectively. Following a 27-day deployment period, the Bio-Traps were recovered to quantify  $^{13}\text{C}$  incorporation into biomass and dissolved inorganic carbon (DIC). A complete summary of the SIP results is provided in Table 1 and Figures 1 through 5. Tables 2 and 3 and Figures 6 through 9 contain summaries of PLFA analysis performed on standard Bio-Trap samplers deployed in BSA and CPA monitoring wells.

### Stable Isotope Probing (SIP)

- The detection of  $^{13}\text{C}$ -enriched biomass and DIC confirmed that benzene biodegradation had occurred at BSA-MW-2D-0217 during the deployment period.
  - Total PLFA biomass for well BSA-MW-2D-0217 ( $2.33\text{E+}05$  cells/bead) was in the moderate range.
  - The average PLFA  $\delta^{13}\text{C}$  value was  $3,706\text{\textperthousand}$ , indicating a high level of incorporation of  $^{13}\text{C}$ -labeled benzene into microbial biomass.
  - The average DIC  $\delta^{13}\text{C}$  value was  $4,919\text{\textperthousand}$ , indicating that benzene was mineralized under current site conditions.
  - The PLFA community structure was primarily composed of monoenoics (53.97%) followed by eukaryotes (29.37%). Indicators of normal saturates, firmicutes, and actinomycetes were also detected.
- Evidence for biodegradation of chlorobenzene in CPA-MW-3D-0217 was inconclusive, as the  $^{13}\text{C}$ -enriched biomass fell below the detection limit.
  - The average DIC  $\delta^{13}\text{C}$  value,  $-6\text{\textperthousand}$ , was near background levels and indicated little to no chlorobenzene was mineralized during the deployment period.
  - Total PLFA biomass for well CPA-MW-3D-0217 ( $1.38\text{E+}05$  cells/bead) was in the moderate range.
  - The PLFA community structure was primarily composed of monoenoics (61.96%) followed by normal saturates (21.29%). Indicators of eukaryotes, actinomycetes, anaerobic metal reducers, and firmicutes were also detected.

### PLFA Analysis - Standard Bio-Traps

- Total biomass concentrations in the standard BSA bio-traps fell within the low to moderate range ( $10^4$  to  $10^5$  cells/bead). Total biomass in BSA-MW-3D-0217 fell between the reporting and detection limits for PLFA.
- The community structures in the standard BSA bio-traps indicated that monoenoics and normal saturates were the most abundant groups.
- In the CPA wells, total PLFA biomass concentrations fell within the low to moderate range ( $10^4$  to  $10^5$  cells/bead). The total biomass fell between the reporting and detection limits for PLFA in CPA-MW-5D-0217.
- The microbial community structures in the CPA wells were primarily composed of a large portion of monoenoics followed by normal saturates similar to the BSA wells.

# Overview of Approach

## Stable Isotope Probing (SIP)

Stable isotope probing (SIP) is an innovative method to track the environmental fate of a “labeled” contaminant of concern to unambiguously demonstrate biodegradation. Two stable carbon isotopes exist in nature – carbon 12 ( $^{12}\text{C}$ ) which accounts for 99% of carbon and carbon 13 ( $^{13}\text{C}$ ) which is considerably less abundant (~1%). With the SIP method, the Bio-Trap® sampler is baited with a specially synthesized form of the contaminant containing  $^{13}\text{C}$  labeled carbon. Since  $^{13}\text{C}$  is rare, the labeled compound can be readily differentiated from the contaminants present at the site. Following deployment, the Bio-Trap® is recovered and three approaches are used to conclusively demonstrate biodegradation of the contaminant of concern.

- The loss of the labeled compound provides an estimate of the degradation rate (% loss of  $^{13}\text{C}$ ).
- Quantification of  $^{13}\text{C}$  enriched phospholipid fatty acids (PLFA) indicates incorporation into microbial biomass.
- Quantification of  $^{13}\text{C}$  enriched dissolved inorganic carbon (DIC) indicates contaminant mineralization.

## Phospholipid Fatty Acids (PLFA)

PLFA are a primary component of the membrane of all living cells including bacteria. PLFA decomposes rapidly upon cell death (1, 2), so the total amount of PLFA present in a sample is indicative of the viable biomass. When combined with stable isotope probing (SIP), incorporation of  $^{13}\text{C}$  into PLFA is a conclusive indicator of biodegradation.

Some organisms produce “signature” types of PLFA allowing quantification of important microbial functional groups (e.g. iron reducers, sulfate reducers, or fermenters). The relative proportions of the groups of PLFA provide a “fingerprint” of the microbial community. In addition, *Proteobacteria* modify specific PLFA during periods of slow growth or in response to environmental stress providing an index of their health and metabolic activity.

## Interpretation

Interpretation of the results of the SIP Bio-Trap® study must be performed with due consideration of site conditions, site activities, and the desired treatment mechanism. The following discussion describes interpretation of results in general terms and is meant to serve as a guide.

**Contaminant Concentration:** Bio-Traps® are baited with a  $^{13}\text{C}$  labeled contaminant of concern and a pre-deployment concentration is determined prior to shipping. Following deployment, Bio-Traps® are recovered for analysis including measurement of the concentration of the  $^{13}\text{C}$  labeled contaminant remaining. Pre- and post-deployment concentrations are used to calculate percent loss.

**Biomass Concentrations:** PLFA analysis is one of the most reliable and accurate methods available for the determination of viable (live) biomass. Phospholipids break down rapidly upon cell death, so biomass calculations based on PLFA content do not include "fossil" lipids from dead cells. Total biomass (cells/bead) is calculated from total PLFA using a conversion factor of 20,000 cells/pmol of PLFA. When making comparisons between wells, treatments, or over time, differences of one order of magnitude or more are considered significant.

Total Biomass		
Low	Moderate	High
$10^3$ to $10^4$ cells	$10^5$ to $10^6$ cells	$10^7$ to $10^8$ cells

For SIP studies, the  $^{13}\text{C}$  enriched PLFA is also determined to conclusively demonstrate contaminant biodegradation and quantify incorporation into biomass as a result of the  $^{13}\text{C}$  being used for cellular growth. The %  $^{13}\text{C}$  incorporation ( $^{13}\text{C}$  enriched biomass/total biomass) is also provided in the data summary table, but the value must be interpreted carefully especially when comparing wells or treatments. Typically, biodegradation of a contaminant of concern is performed by a small subset of the total microbial community. For Bio-Traps® with large total biomass, the %  $^{13}\text{C}$  incorporation value could be low despite significant  $^{13}\text{C}$  labeled biomass and loss of the compound. The %  $^{13}\text{C}$  incorporation should be viewed in light of total biomass, percent loss, and dissolved inorganic carbon (DIC) results.

$^{13}\text{C}$  enrichment data is often reported as a del value. The del value is the difference between the isotopic ratio ( $^{13}\text{C}/^{12}\text{C}$ ) of the sample ( $R_x$ ) and a standard ( $R_{\text{std}}$ ) normalized to the isotopic ratio of the standard ( $R_{\text{std}}$ ) and multiplied by 1,000 (units are parts per thousand, denoted ‰).

$R_{\text{std}}$  is the naturally occurring isotopic ratio and is approximately 0.011180 (roughly 1% of naturally occurring carbon is  $^{13}\text{C}$ ). The isotopic ratio,  $R_x$ , of PLFA is typically less than the  $R_{\text{std}}$  under natural conditions, resulting in a del value between -20 and -30‰. For a SIP Bio-Trap® study, biodegradation and incorporation of the  $^{13}\text{C}$  labeled compound into PLFA results in a larger  $^{13}\text{C}/^{12}\text{C}$  ratio ( $R_x$ ) and thus del values greater than under natural conditions. Typical PLFA del values are provided below.

PLFA Del (‰)		
Low	Moderate	High
0 to 100	100 to 1,000	>1,000

**Dissolved Inorganic Carbon (DIC):** Often, bacteria can utilize the  $^{13}\text{C}$  labeled compound as both a carbon and energy source. The  $^{13}\text{C}$  portion used as a carbon source for growth can be incorporated into PLFA as discussed above, while the  $^{13}\text{C}$  used for energy is oxidized to  $^{13}\text{CO}_2$  (mineralized).

$^{13}\text{C}$  enriched  $\text{CO}_2$  data is often reported as a del value as described above for PLFA. Under natural conditions, the  $R_x$  of  $\text{CO}_2$  is approximately the same as  $R_{\text{std}}$  (0.01118 or about 1.1%  $^{13}\text{C}$ ). For an SIP Bio-Trap® study, mineralization of the  $^{13}\text{C}$  labeled contaminant of concern would lead to a greater value of  $R_x$  (increased  $^{13}\text{CO}_2$  production) and thus a positive del value. As with PLFA, del values between 0 and 100‰ are considered low, values between 100 and 1,000‰ are considered moderate, and values greater than 1,000‰ are considered high. Thus DIC % $^{13}\text{C}$  are considered low if the value is less than 1.23%, moderate if between 1.23 and 2.24%, and high if greater than 2.24%.

Dissolved Inorganic Carbon (DIC) Del and % $^{13}\text{C}$		
Low	Moderate	High
0 to 100	100 to 1,000	>1,000
1.11 to 1.23%	1.23 to 2.24%	>2.24%

**Community Structure (% total PLFA):** Community structure data is presented as a percentage of PLFA structural groups normalized to the total PLFA biomass. The relative proportions of the PLFA structural groups provide a “fingerprint” of the types of microbial groups (e.g. anaerobes, sulfate reducers, etc.) present and therefore offer insight into the dominant metabolic processes occurring at the sample location. Thorough interpretation of the PLFA structural groups depends in part on an understanding of site conditions and the desired microbial biodegradation pathways. For example, an increase in mid chain branched saturated PLFA (MidBrSats), indicative of sulfate reducing bacteria (SRB) and *Actinomycetes*, may be desirable at a site where anaerobic BTEX biodegradation is the treatment mechanism, but would not be desirable for a corrective action promoting aerobic BTEX or MTBE biodegradation. The following table provides a brief summary of each PLFA structural group and its potential relevance to bioremediation.

**Table 2.** Description of PLFA structural groups.

PLFA Structural Group	General classification	Potential Relevance to Bioremediation Studies
<b>Monoenoic (Monos)</b>	Abundant in Proteobacteria (Gram negative bacteria), typically fast growing, utilize many carbon sources, and adapt quickly to a variety of environments.	Proteobacteria is one of the largest groups of bacteria and represents a wide variety of both aerobes and anaerobes. The majority of Hydrocarbon utilizing bacteria fall within the Proteobacteria
<b>Terminally Branched Saturated (TerBrSats)</b>	Characteristic of Firmicutes (Low G+C Gram-positive bacteria), and also found in Bacteroides, and some Gram-negative bacteria (especially anaerobes).	Firmicutes are indicative of presence of anaerobic fermenting bacteria (mainly <i>Clostridia/Bacteroides</i> -like), which produce the H <sub>2</sub> necessary for reductive dechlorination
<b>Branched Monoenoic (BrMonos)</b>	Found in the cell membranes of micro-aerophiles and anaerobes, such as sulfate- or iron-reducing bacteria	In contaminated environments high proportions are often associated with anaerobic sulfate and iron reducing bacteria
<b>Mid-Chain Branched Saturated (MidBrSats)</b>	Common in sulfate reducing bacteria and also Actinobacteria (High G+C Gram-positive bacteria).	In contaminated environments high proportions are often associated with anaerobic sulfate and iron reducing bacteria
<b>Normal Saturated (Nsats)</b>	Found in all organisms.	High proportions often indicate less diverse populations.
<b>Polyenoic</b>	Found in higher plants, and animals.	Eukaryotic scavengers will often prey on contaminant utilizing bacteria.

**Physiological Status (*Proteobacteria*):** Some *Proteobacteria* modify specific PLFA as a strategy to adapt to stressful environmental conditions (3, 4). For example, *cis* monounsaturated fatty acids may be modified to cyclopropyl fatty acids during periods of slowed growth or modified to *trans* monounsaturated fatty acids to decrease membrane permeability in response to environmental stress. The ratio of product to substrate fatty acid thus provides an index of their health and metabolic activity. In general, status ratios greater than 0.25 indicate a response to unfavorable environmental conditions.

## Glossary

**Del:** A Del value is the difference between the isotopic ratio ( $^{13}\text{C}/^{12}\text{C}$ ) of the sample ( $R_x$ ) and a standard ( $R_{\text{std}}$ ) normalized to the isotopic ratio of the standard ( $R_{\text{std}}$ ) and multiplied by 1,000 (units are parts per thousand denoted ‰).

$$\text{Del} = (R_x - R_{\text{std}})/R_{\text{std}} \times 1000$$
