The EDMAN program will use EPA standard qualifiers. Definitions for these qualifiers are provided below.

Table A-10 Qualifier

Lab Qualifier	Description
*	duplicate not within control limits INORGANICS – Value outside QC Limits.
+	INORGANICS- Correlation coefficient for the MSA < 0.995
<	reported value less than noted detection limit
A	Indicates tentatively identified compounds that are suspected to be aldol condensation products.
B	ORGANICS – indicates the analyte is detected in the associated blank as well as in the sample. INORGANICS – reported value was obtained from a reading that was less than the contract required detection limit (crdl) but greater than or equal to the instrument detection limit (idl). If the analyte was analyzed for but not detected a “u” shall be entered.
C	indicates pesticide results have been confirmed by gc/ms.
D	Indicates an identified compound in an analysis that has been diluted. This flag alerts the data user to any differences between the concentrations reported in the two analyses. INORGANICS – The result is faulty due to problems outside the realm of typical validation rules/ flags. This qualifier maybe affixed to a result when the data validator has reason to consider the result suspect, warranting notification of the end user of a dilution
E	ORGANICS- Indicates compounds whose concentrations exceed the calibration range of the instrument. INORGANICS- Sample Result is estimated and Biased High
F	The result is faulty due to problems outside the realm of typical validation rules/flags. This qualifier may be affixed to a result when the data validator has reason to consider the result suspect, warranting notification of the end user
G	Indicates the TCLP matrix spike recovery was greater than the upper limit of the analytical method.
H	Biased high.
HT	Exceeds Holding Time
I	matrix interference
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of a compound but the result is less than the sample quantitation limit, but greater than zero. The flag is also used to indicate a report result having an associated qc problem. INORGANIC - Matrix interference
J-	estimated on the low side
J+	estimated on the high side
K	reported concentration value is proportional to dilution factor and may be exaggerated
L	Biased low.
M	Indicates that the duplicate injection precision was not met.

Table A-10 Qualifier

Lab_Qualifieries	Description
N	ORGANICS – Indicates presumptive evidence of a compound. This flag is usually used for a tentatively identified compound, where the identification is based on a mass spectral library search. INORAGNICS – Sample Result is estimated and biased low.
NJ	The analysis indicates the present of an analyte for which there is presumptive evidence to make a tentative identification and the associated numerical value represents its approximate concentration.
P	Indicates a pesticide/aroclor target analyte had a percent difference greater than 25% between the two gc columns. The lower of the two results is reported.
R	Indicates the data are unusable. (Note: The analyte may or may not be present.)
S	Indicates that the reported values were determined by the method of standard additions.
U	Indicates that the compound was analyzed for, but not detected. The sample quantitation limit corrected for dilution and percent moisture is reported. INORGANIC – Indicates a pesticide/ aroclor target analyte had a percent difference greater than 25% between the two GC colums. The lower of the two results is reported.
W	Post-digestion spike out of control limits etc.
X	Recovered amount of spike is less than the project reporting limit.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the action limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

The following table consists of the types of well segments available for entry into segment_type field and the associated material type of the segment. Entry of data into segment_type and material_type_code fields is restricted to the vocabulary listed in this table. Figure 7-1 presents a monitoring well diagram detailing the various well segments.

Notes:

- Bentonite is abbreviated as bent for certain material_type_codes in order to adhere to the field restriction of 20 characters.
- Segment_types consisting of materials with trade names of Teflon, Halon, Fluon, Hostafion, Polyflon, Neoflon, Kynar, Kel-F, and Diaflon should use *fluoropolymer* as material_type_code.

Figure A-1 Monitoring Well Diagram

The following figure shows the lithology and 5 possible geologic units associated with a soil boring. Data providers are requested to provide only 2 geologic units, however 5 units are shown to illustrate a number of possible geologic units.

Figure A-2 Example of Geologic Units

Please note that this depiction is entirely conceptual, and no scientific correctness in relationship between geologic units is intended. The sole purpose is to demonstrate how multiple geologic units may be utilized.
