USEPA MOVES Review Workgroup  
Ann Arbor, MI October 9, 2019

# Overview

- **Modeling Tools**
  - **MOVES-Matrix for energy and emissions**
  - **Georgia Tech Fuel and Emissions Calculator (FEC)**
- **Application Linkages:**
  - **Travel demand and activity-based modeling (ABM)**
  - **Traffic simulation models (Vissim™, DTA, etc.)**
  - **Data-driven real-time simulation**
  - **Monitored corridor-level vehicle activity**
  - **Pollutant dispersion models (AERMOD, etc.)**
- **Ongoing modeling work (dissertations)**

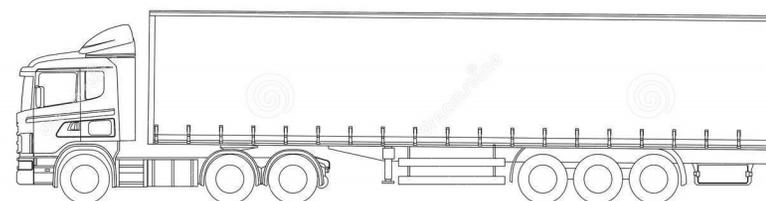

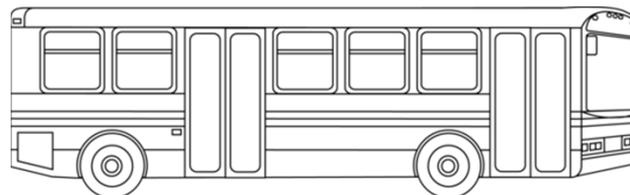

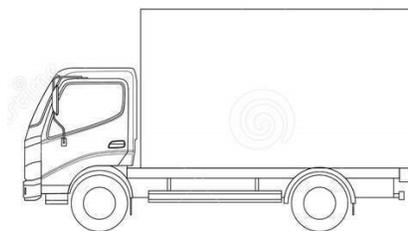

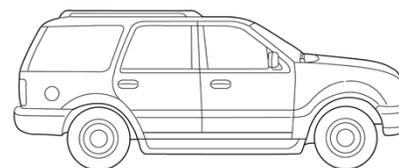

# MOVES Modeling

$$VSP = \left(\frac{A}{M}\right)v + \left(\frac{B}{M}\right)v^2 + \left(\frac{C}{M}\right)v^3 + \left(\frac{m}{M}\right)(a + g * \sin \theta)v$$

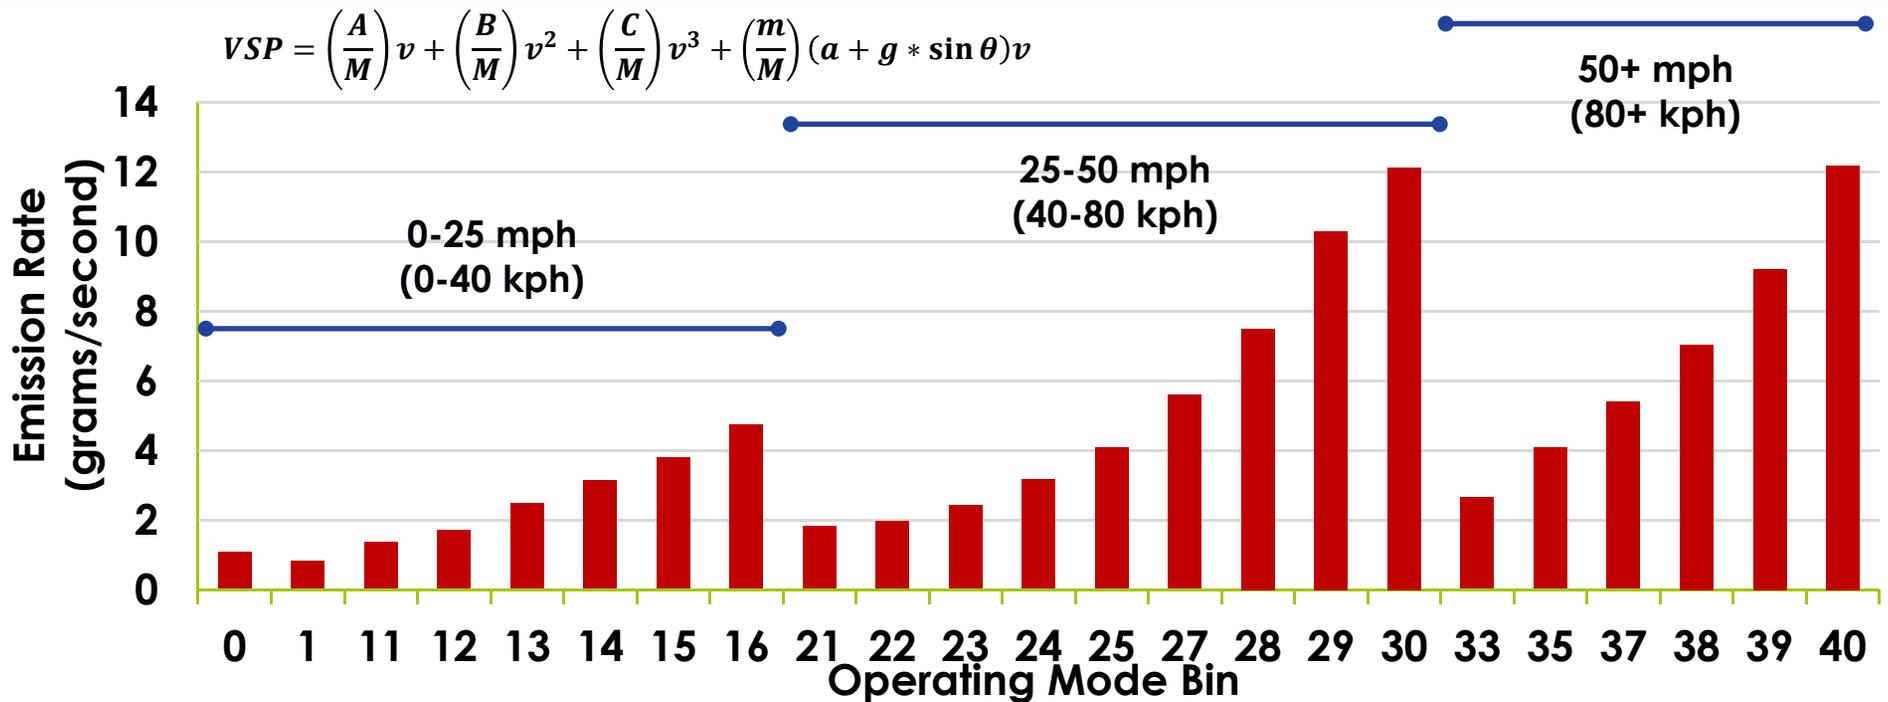

- EPA's Motor Vehicle Emissions Simulator (MOVES)
- Emissions are defined as a function of speed and vehicle-specific power (VSP) to account for the impact of speed and acceleration on energy and emissions
- MOVES translates inputs into the VSP framework, processes the inputs, and translates results back into user-required outputs

# 13 MOVES Source Types

Source Type Name	Source Type ID
Motorcycle	11
Passenger Car	21
Passenger Truck	31
Light Commercial Truck	32
Intercity Bus	41
Transit Bus	42
School Bus	43
Refuse Truck	51
Single-Unit Short Haul Truck	52
Single-Unit Long Haul Truck	53
Motor Home	54
Combination Short Haul Truck	61
Combination Long Haul Truck	62

# Example CO<sub>2</sub> Emission Rates by VSP Bin for Passenger Trucks (2016MY in 2016)

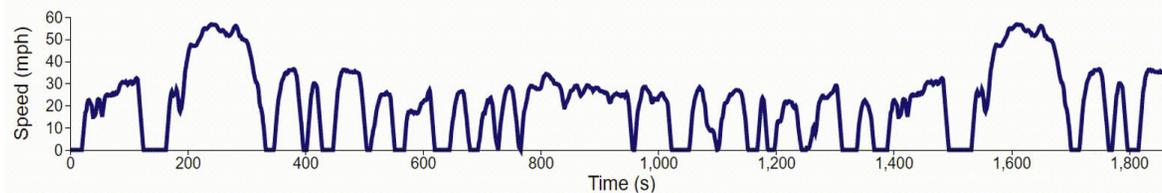

23 operating mode bins  
 0 = braking, 1 = idle, 11 = coast, 21 = coast

# Traditional MOVES Modeling

- **Modeling of complicated and dynamic networks is tedious**
  - **Requires generation of many link emission rates**
  - **Users often generate lookup tables to support modeling**
- **GT Goal: Pre-run MOVES for all combinations of input data**
  - **Configure MOVES for distributed computing**
  - **Iterate runs across all input combinations**
  - **Compile emission rates into a multi-dimensional matrix**

# MOVES Runs per Region

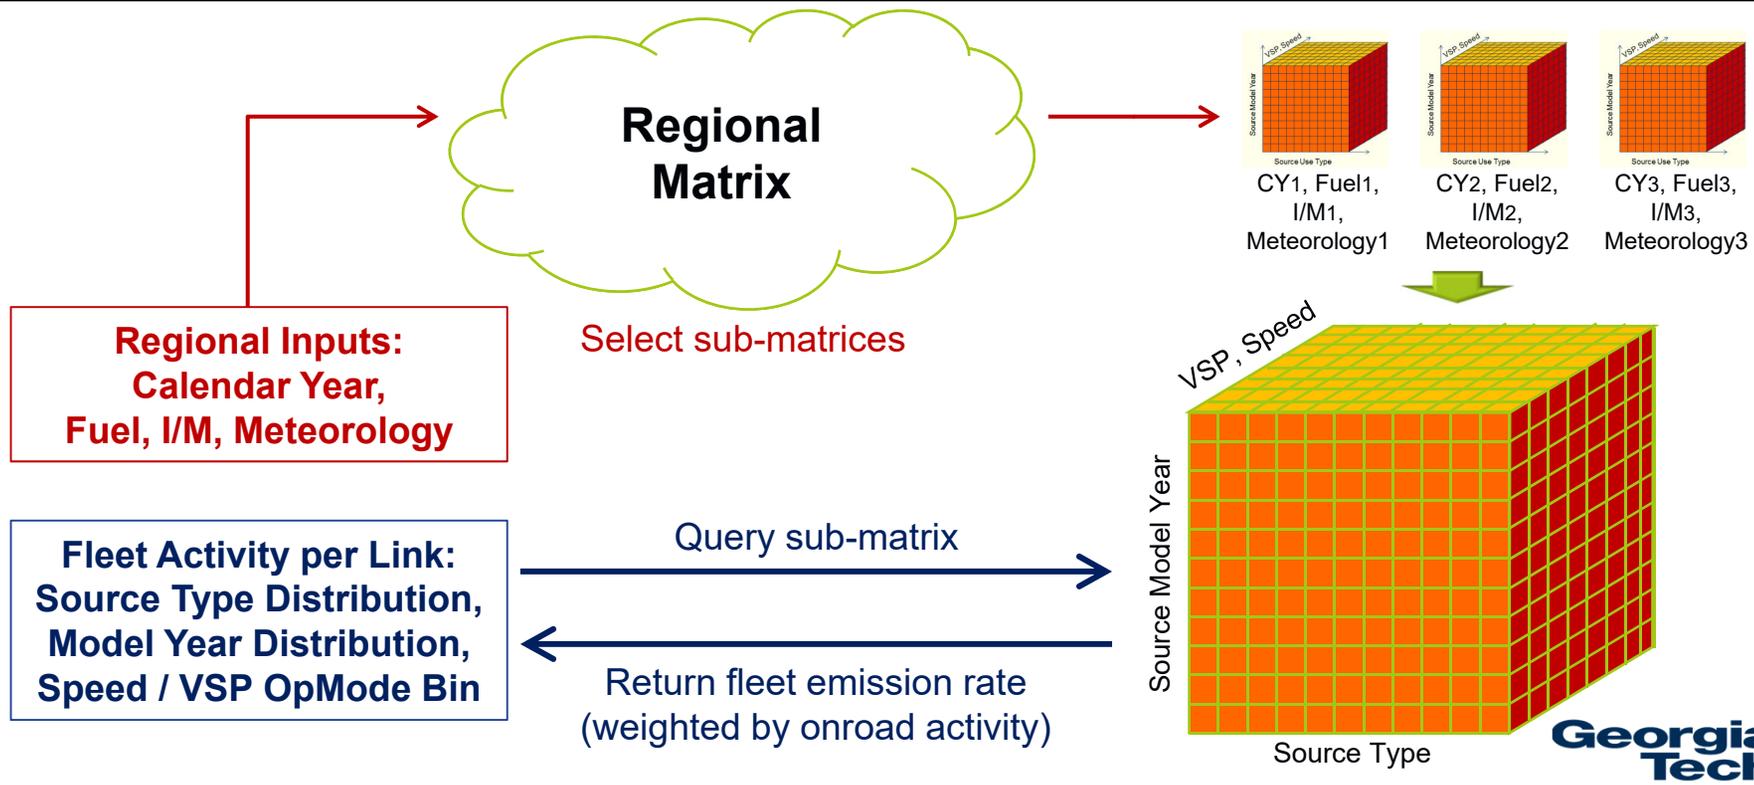

- **30,429 MOVES on-road exhaust runs**
  - **21 calendar years**
  - **3 fuel months (summer, winter, transition)**
  - **23 temperature bins (5°F bins)**
  - **21 humidity bins (5% bins)**
- **20 minutes/core/run**
  - **Five days in PACE (80+ sustained cores assigned)**
- **5,348,983,500 running emission rates per region**
- **121.2 Gb emission rate matrix per region**
- **1.2 millions of MOVES runs to date**

# Partnership for an Advanced Computing Environment (PACE)

- Partnership between Georgia Tech faculty, researchers, and the Georgia Tech Office of Information Technology
  - 35,000 cores
  - 90 terabytes memory
  - 2 petabytes of storage

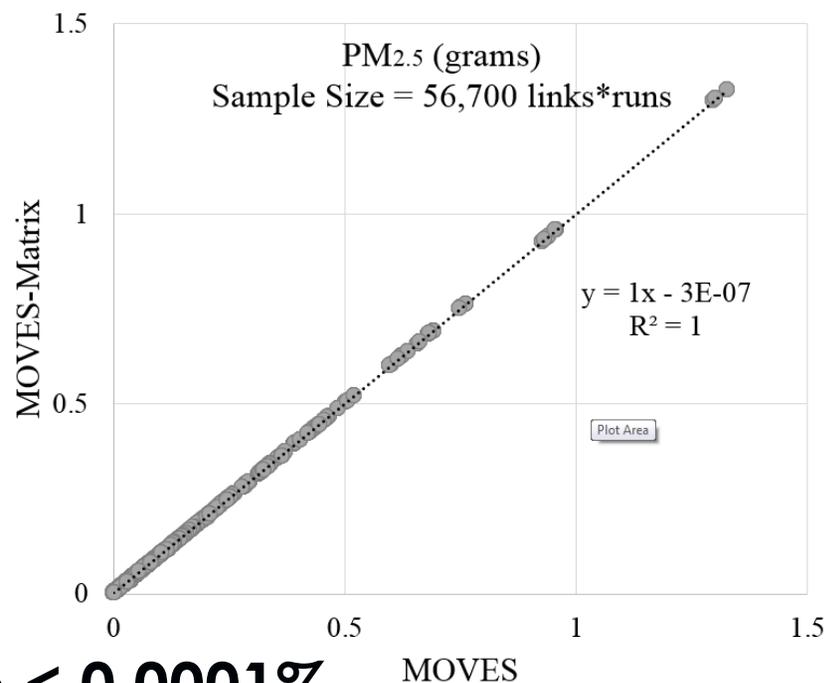

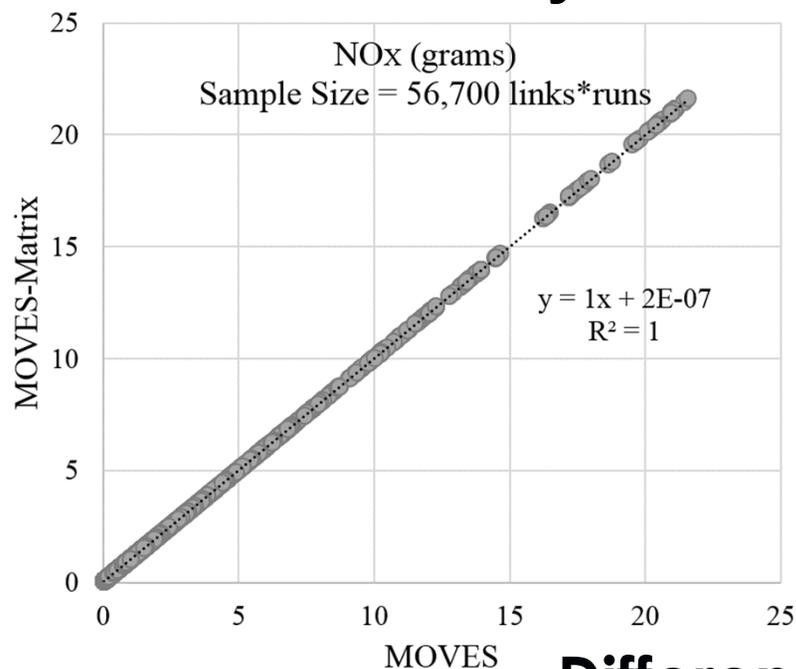

# MOVES-Matrix Run Module: Developing On-Road Fleet Emission Rates

# MOVES vs. MOVES-Matrix Results

➤ Results are exactly the same as MOVES GUI results

**Difference < 0.0001%**

# MOVES-Matrix 2.0

- **MOVES-Matrix for regional inventory modeling**
  - **Start exhaust, truck hoteling, and evaporative emissions**
- **Atlanta regional inventory case study**
- **MOVES-Matrix generates exactly the same results**
- **Provides tremendous flexibility for use in scenario analysis**

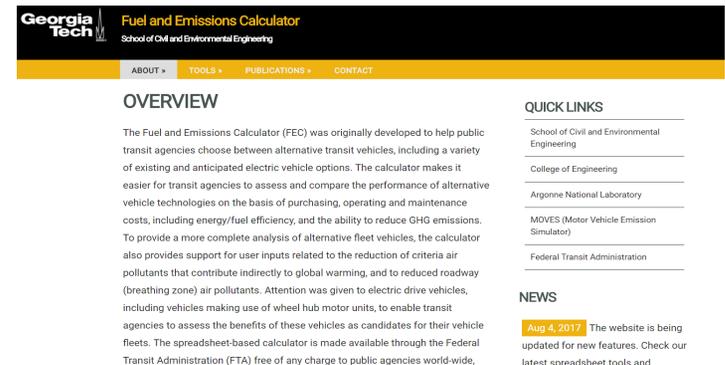

Xu, X., H. Liu, H. Li, M.O. Rodgers, R. Guensler (2018). "Integrating Engine Start, Soak, Evaporative, and Truck Hoteling Emissions into MOVES-Matrix." Transportation Research Record. Washington, DC. 2018.

# Fuel and Emissions Calculator (FEC)

<http://fec.ce.gatech.edu/>

- Originally transit-only, to help agencies assess and compare alternative transit vehicle technologies
  - Capital costs
  - Operating/maintenance costs
  - Energy use and emissions
  - Includes hybrids and EVs
- Lifecycle analysis
  - On-road pump-to-wheel (PTW) from MOVES-Matrix
  - Upstream well-to-pump (WTP) from GREET

**Georgia Tech** Fuel and Emissions Calculator  
School of Civil and Environmental Engineering

ABOUT > TOOLS > PUBLICATIONS > CONTACT

### OVERVIEW

The Fuel and Emissions Calculator (FEC) was originally developed to help public transit agencies choose between alternative transit vehicles, including a variety of existing and anticipated electric vehicle options. The calculator makes it easier for transit agencies to assess and compare the performance of alternative vehicle technologies on the basis of purchasing, operating and maintenance costs, including energy/fuel efficiency, and the ability to reduce GHG emissions. To provide a more complete analysis of alternative fleet vehicles, the calculator also provides support for user inputs related to the reduction of criteria air pollutants that contribute indirectly to global warming, and to reduced roadway (breathing zone) air pollutants. Attention was given to electric drive vehicles, including vehicles making use of wheel hub motor units, to enable transit agencies to assess the benefits of these vehicles as candidates for their vehicle fleets. The spreadsheet-based calculator is made available through the Federal Transit Administration (FTA) free of any charge to public agencies world-wide.

### NEWS

**Aug 4, 2017** The website is being updated for new features. Check our latest spreadsheet tools and

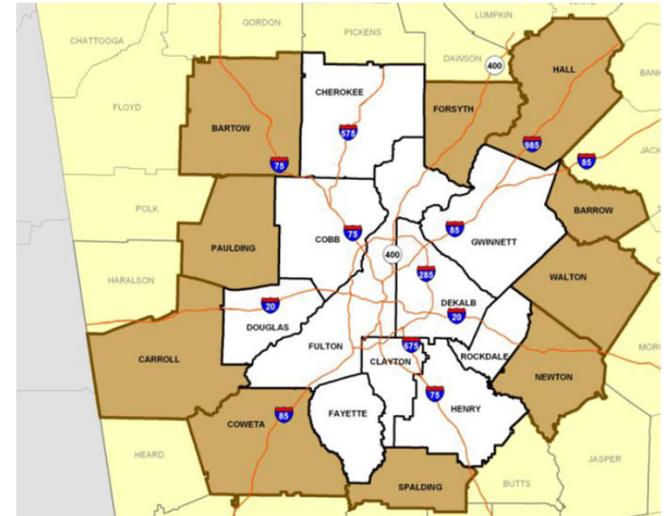

# MOVES-Matrix Applications

- **MOVES-Matrix can be applied at any spatial and temporal scale and can be linked with any model via Python scripts**
  - **Regional travel demand models**
  - **Corridor/scenario analysis**
  - **Vissim™ and other microscopic simulation models**
  - **Microscale pollutant dispersion modeling**
  - **App-based vehicle energy and emissions modeling**
- **The FEC and Cost Calculator can be applied in series**

# MOVES-Matrix 2.0

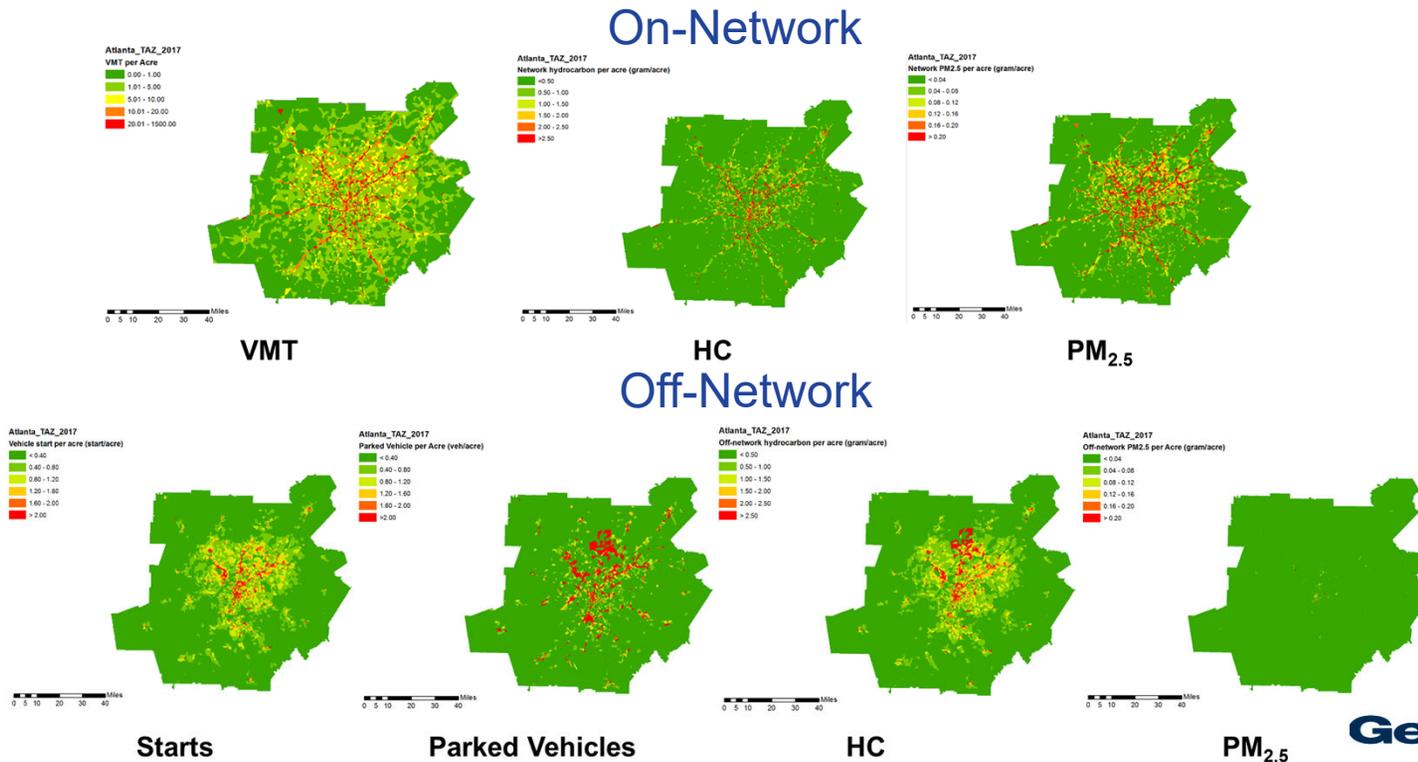

## Travel Demand Model Connectivity

- **MOVES-Matrix 2.0**
- **Atlanta Regional Commission's (ARC's) regional activity-based travel demand model ABM**
- **Activity-based model (ABM) predicts trips (origin-destination) and link-level travel**
  - **5,873 zones**
  - **74,469 network links**

Regional Emission Analysis with Travel Demand Models and MOVES-Matrix (18-05363). 97th Annual Meeting of the Transportation Research Board (presentation only, full paper review, extended abstract in proceedings). Washington, DC. January 2018.

# Vissim™ Microscopic Simulation

- Automated linkage between Vissim™ and MOVES-Matrix
- Python scripts
  - Run Vissim™ microscopic simulation (defined network)
  - Retrieve vehicle trace data via Vissim™ COM interface
  - Assign source types
  - Process sec-by-sec trace data to VSP
  - Match to MOVES-Matrix energy/emission rates
  - Append energy/emissions to trace data

Xu, X., H. Liu, Y. Xu, M. Hunter, and R. Guensler (2016). "Estimating Project-level Vehicle Emissions using Vissim™ and MOVES Matrix." DOI 10.3141/2570-12. Transportation Research Record. Number 2570. pp. 107-117. National Academy of Sciences. Washington, DC. 2016.

# AERMOD-Grid Case Study for PM<sub>2.5</sub>

- Atlanta Metropolitan Area
- All highways (I-85, I-75, I-20, etc.)
- 1,163 roadway miles
  - 976 highway miles
  - 189 ramp miles
- 5,642 polygon link segments
- 54,017 receptors
- 7-day PACE modeling run

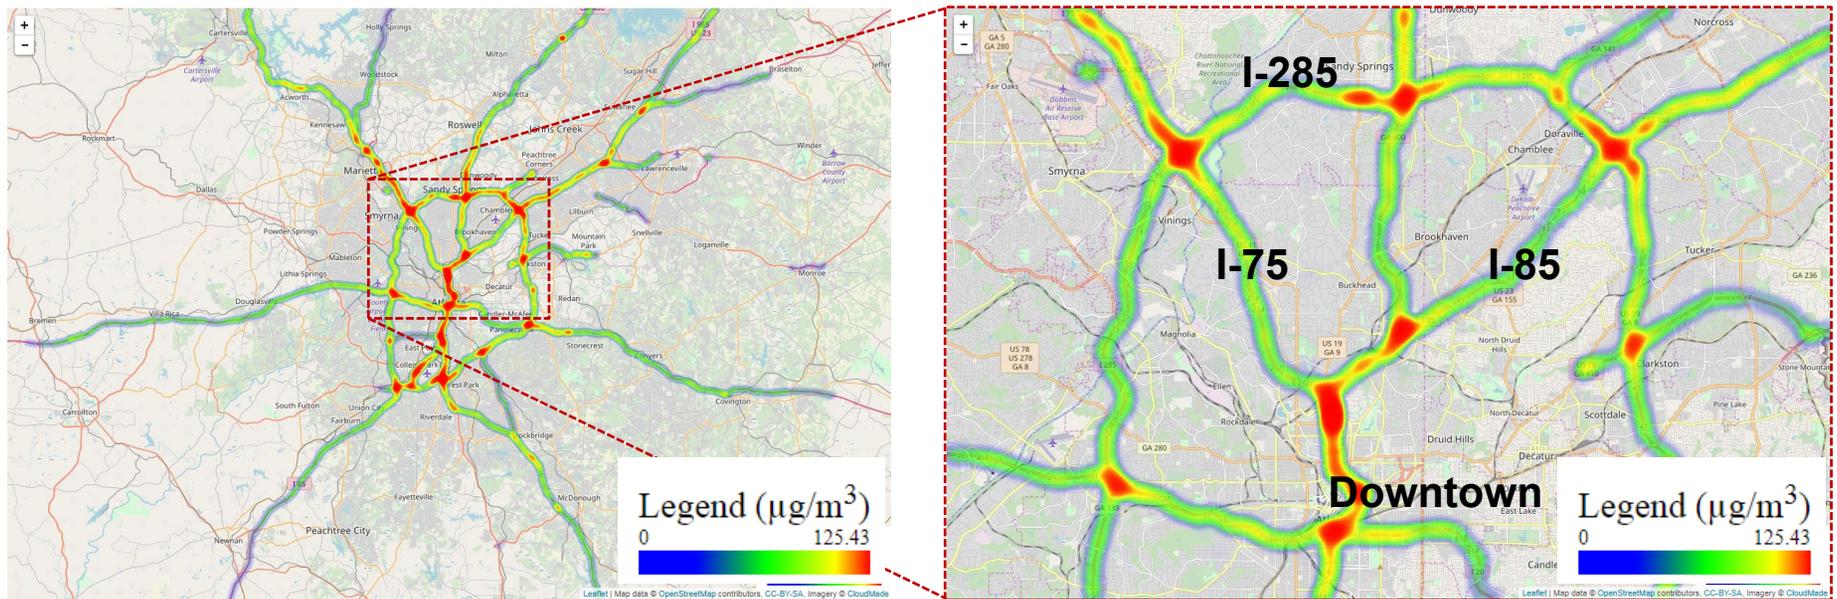

Results can be found at:

# PM<sub>2.5</sub> Emissions and Dispersion Modeling (Atlanta Regional Case Study)

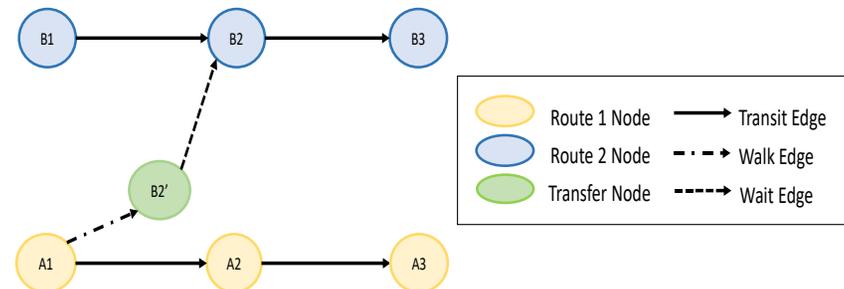

- Atlanta freeway worst case AERMOD assessment
- Identifies areas for more refined modeling

# RoadwaySim (Regional Roadway Simulator) TransitSim (Regional Transit Simulator)

## ➤ Python-based shortest-path models

- 203,000-link road network
- 90+ MARTA bus/rail routes
- 23 GRTA Xpress Bus routes

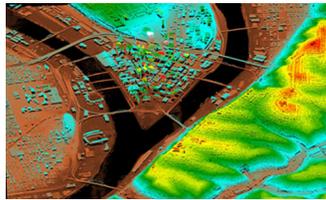

- Users input origin-destination pair and departure time
- Simulators find shortest path trajectories through the STM
  - Trajectories move through space and time
  - Accounts for congestion formation and dissipation

# Ongoing Work

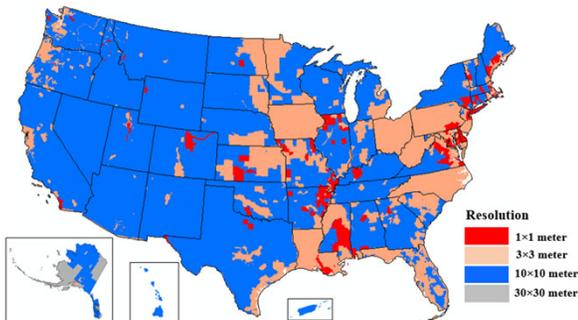

- **New dissertations and theses:**
  - **Road grade integration into the modeling tools**
  - **Autonomie-based, simulation-informed, VSP modeling of hybrid/electric vehicles**
  - **Transit fleet EV integration optimization model**
- **Forthcoming:**
  - **Distributive justice assessment tools for planning**
  - **Pollutant exposure assessment tools for health effects**

# Road Grade Development using the U.S. Geological Survey Digital Elevation Model

# Summary

- **MOVES-Matrix (brute-force cluster modeling with MOVES)**
  - **Obtains exactly the same energy and emissions rates**
- **Can be applied at any spatial and temporal scale**
  - **Regional, corridor case studies, simulations, apps, etc.**
  - **Can link to dispersion modeling (AERMOD-Grid)**
- **Matrices are very large (Python scripts are required)**
  - **Python, distributed computing, GIS, visualization, traditional modeling (regional, simulation, dispersion)**
- **Big data and deep learning applications are evolving**
