

1 in 100,000 is EPA's risk threshold. This means that in a town of 100,000 people, at most 1 additional person might develop cancer over a lifetime (70 years) of exposure to chemicals emitted from the Evoqua facility.

With regard to this threshold, EPA has determined that impacts from long-term exposure to the Evoqua facility emissions are insignificant.

What Typically Comes Out of the Smokestack?

Contacts

Please contact the following with questions or comments:

“Mike” Mahfouz Zabaneh, Project Manager
Phone: (415) 972-3348
zabaneh.mahfouz@epa.gov
