

ASSET MANAGEMENT 101

Webinar Presented by EPA Office of Ground Water and Drinking Water

Thursday, January 21, 2021 from 2:00-3:00 pm EST

Registration: <https://attendee.gotowebinar.com/register/7576553619867152653>

Asset management provides utility managers and other decision-makers with critical information on capital assets and timing of investments. It can help a utility maximize the value of its capital as well as its operations and maintenance dollars.

Managing infrastructure capital assets to minimize the total cost of owning and operating those assets while delivering the desired service levels are the goals of the ongoing practices of asset management.

This webinar will be a comprehensive guide to the core components of an asset management framework, as well as best practices, presented by Alison Flenniken, EPA's National Capacity Development Coordinator. Attendees will also learn about New Hampshire's program to encourage asset management implementation, presented by Luis Ardon.

Prior to the webinar, we encourage attendees to familiarize themselves with the EPA's overview of asset management for water and wastewater utilities.

You can find the overview at: <https://www.epa.gov/sustainable-water-infrastructure/asset-management-water-and-wastewater-utilities>
