

## Profile of an Average U.S. Supermarket's Greenhouse Gas Impacts from Refrigeration Leaks Compared to Electricity Consumption

This is a profile of an average U.S. supermarket and the resulting Greenhouse Gas (GHG) impacts from leaked refrigerants and electricity consumption in a given year. The GHG estimates are based on the assumptions and industry information cited below and provided in pounds and metric tonnes of carbon dioxide equivalent (CO<sub>2</sub>eq). To calculate your specific store's GHG impact from refrigeration leaks and electricity consumption use the corresponding GreenChill calculator.

U.S. Supermarket Store Size <sup>1</sup>	46,000 square feet
Annual Electricity Consumption Intensity for U.S. Supermarkets <sup>2</sup>	51 kilowatt hours per square foot
Annual Electricity Consumed (Annual Consumption Intensity x Store Size)	2,346,000 kilowatt hours per year
Electricity Use Emission Factor (U.S. Average) <sup>3</sup>	1.30 pounds of CO <sub>2</sub> eq per kilowatt hour
<b>Annual CO<sub>2</sub>eq Emissions from Electricity Consumption</b>	<b>3,120,180 pounds of CO<sub>2</sub> per year</b>
<b>Annual CO<sub>2</sub>eq Emissions from Electricity Consumption (metric)</b>	<b>1,383 metric tonnes of CO<sub>2</sub> per year</b>
Typical Commercial Refrigerant Used <sup>4</sup>	R-404A
Global Warming Potential (AR4 standard) <sup>5</sup>	3,921.6
Commercial Refrigeration Charge Size <sup>6</sup>	3,500 pounds
Annual Commercial Refrigeration Leak Rate <sup>7</sup>	25% per year
Annual Volume of Commercial Refrigerant Leaked	875 pounds per year
<b>Annual CO<sub>2</sub>eq of R-404A Leaked</b>	<b>3,431,400 pounds of CO<sub>2</sub>eq per year</b>
<b>Annual CO<sub>2</sub> eq of R-404A Leaked (metric)</b>	<b>1,556 metric tonnes of CO<sub>2</sub>eq per year</b>
